

UNIVERSITY OF CALICUT

Abstract

General & Academic - Faculty of Science - MSc Physics Programme - Incorporation of the experiments in Part B of PHY3L05 & PHY4L06 (MODERN PHYSICS) in the Syllabus for affiliated colleges under CBCSS PG Regulations 2019 with effect from 2020 Admission - Implemented- Orders Issued.

G & A - IV - J

U.O.No. 9094/2022/Admn

Dated, Calicut University.P.O, 25.04.2022

- Read:-*1. U.O.No. 5811/2021/Admn Dated, 31.05.2021
2. Item no.3 in the minutes of the meeting of Board of Studies in Physics PG, held on 04.04.2022
3. Remarks of the Dean, Faculty of Science, dated 20.04.2022
4. Order of the Vice Chancellor in the file of even no. dtd 21.04.2022

ORDER

1. The OBE (Out come based Education) incorporated Syllabus of MSc Physics Programme for affiliated colleges under CBCSS PG Regulations 2019 with effect from 2020 Admission has been implemented, Vide paper read first above.
2. The meeting of the Board of Studies in Physics (PG) held on 04.04.2022, vide paper read second above, resolved to incorporate the following experiments as item X ASTROPHYSICS AND POSITIONAL ASTRONOMY under Part B of PHY3L05 & PHY4L06 (MODERN PHYSICS) in the Syllabus of MSc Physics Programme for affiliated colleges under CBCSS PG Regulations 2019 with effect from 2020 Admission .
 - Use DS9 software to draw the surface profile of a galaxy (use Imexamine and Ximtool). Plot the graph and save it to the disk space.
 - Use Galfit to model an elliptical and lenticular galaxy.
 - Use Vizier service to search and cross-match astronomical catalogues. Use TOPCAT to do the same and plot the sky coordinates.
3. The Dean, Faculty of Science and the Vice Chancellor has approved the above decision in the minutes of the meeting of the Board of Studies in Physics (PG),subject to ratification by Academic Council, vide paper read (3) & (4) respectively.
4. Sanction is therefore accorded for implementing the decision of the Board of Studies in Physics (PG) to incorporate the experiments in the syllabus of MSc Physics programme for affiliated colleges under CBCSS PG Regulations 2019 with effect from 2020 Admission, as detailed in para (2) above, subject to ratification by the Academic Council.
5. Orders are issued accordingly. (Syllabus with incorporated experiments appended.)

UNIVERSITY OF CALICUT

Scheme and Syllabus for

M.Sc (Physics) Programme (CBCSS-PG-2020)

for affiliated colleges (w.e.f. 2020 admission)

Programme objective :

Physics is ultimately mechanics and it furnishes the official framework. It encompasses classical mechanics, quantum mechanics, electrodynamics and statistical mechanics. These are the four pillars upon which the structure of physics is built. In spite of having large number of branches and specializations in physics, the driving source that keeps them united under a common umbrella is mechanics. Any branch of physics which has its roots in the soil of mechanics grows as physics, otherwise it becomes nonphysics. The above mentioned four branches are the foundation subjects in physics. Frontier subjects are those in which current research is going on, such as atomic physics, molecular physics, nuclear physics, plasma physics, solid state physics, materials science, astrophysics etc. Frontier subjects are always rooted in the foundation subjects. Mathematical physics is the theoretical tool and electronics is the experimental tool for exploring physics. In this programme, all the foundation subjects and few frontier subjects are offered as core courses. Because of the time constraint, few other frontier subjects are offered as elective courses. Practicals include general physics, electronics, modern physics and computational physics. A project work also has to be carried out as part of the masters programme. The programme objective is to provide quality education with a firm foundation in physics.

Programme specific outcomes:

On successful completion of the M.Sc Physics programme, students will

P.O.1 acquire a comprehensive knowledge in physics.

P.O.2 will develop a broad understanding of the physical principles of the universe.

P.O.3 acquire laboratory skills to design advanced experiments and high precision measurements.

P.O.4 be proficient in computing and interfacing techniques.

P.O.5 be empowered for critical thinking and innovation in dealing with scientific problems and experiments.

P.O.6 develop advanced laboratory techniques and instrumentation skills for a career in research.

P.O.7 develop independent research skills through projects.

P.O.8 be provided with opportunities to further their knowledge in frontier areas through elective courses.

P.O.9 be empowered for planning career in physical sciences and also in taking up jobs in other fields in the contemporary society.

P.O.10 be able to communicate effectively and participate actively in team work.

The duration of the M.Sc (Physics) programme shall be 2 years, split into 4 semesters. Each course in a semester has 4 credits (4C) with Practicals having 3 credits (3C). The total credits for the entire programme (Core & Elective) is 80. The credits for audit courses is 8. The scheme and syllabus of the programme, consisting of sections (a) *Programme structure* (b) *Courses and credit distribution summary* (c) *Courses in various semesters* (d) *Constitution of clusters* (e) *The credits and hours* (f) *Evaluation and Grading* (g) *Internal evaluation/continuous assessment* (h) *Pattern of question papers* and (I) *Detailed syllabus* are as follows.

a) PROGRAMME STRUCTURE

1. The programme shall include three types of courses : **Core courses, Elective courses and Audit Courses.**
2. Comprehensive Viva voce and Project Work / Dissertation shall be treated as Core Courses and these shall be done in the final semester.
3. Total credit for the programme shall be 80 (eighty), this describes the weightage of the course concerned and the pattern of distribution is as detailed below:
 - i. Total Credit for Core Courses (both theory & practical's) shall be 60 (sixty).
 - ii. Total Credit for Elective Course shall be 12 (twelve).
 - iii. Total Credits for Comprehensive Viva voce and Project Work combined together shall be 8 (eight) subject to a minimum of 4 (four) credit for Project Work.
4. Audit Courses: In addition to the above courses, there will be two Audit Courses (Ability Enhancement Course & Professional Competency Course) with 4 credits each. These have to be done one each in the first two semesters. The credits will not be counted for evaluating the overall SGPA & CGPA. Students have to obtain only minimum pass requirements in the Audit Courses. The details of Audit courses are given below.

Semester	Course Title	Suggested Area	Details
I	Ability Enhancement Course (AEC)	Internship / Seminar presentation / Publications / Industrial or Practical Training /Community linkage programme / Book reviews etc.	Seminar: Each student has to present a seminar on a selected topic in physics. A report has to be prepared and submitted before presenting the seminar. The abstract of the seminar has to be sent to the head of the department through the teacher in charge. Or It can be a course related to any topic from the suggested areas.
II	Professional Competency Course (PCC)	To test the skill level of students like testing the application level of different software such as Latex / Data visualization / Python/Any software relevant to the programme of study / Translations etc.	The students in their second semester will be trained on the use of Latex scientific document preparation system. (The syllabus will be part of the second semester). The latex codes for preparing the following items will be developed. 1. A question paper
			2. A review paper on a topic related to the seminar given in the first semester
			3. A power point presentation
			Evaluation of this will be based on a multiple choice written examination and an internal practical exam.
			Or
			It can be a course related to any topic from the suggested areas.

b) COURSES AND CREDIT DISTRIBUTION SUMMARY:

Semester	Courses	Teaching Hours	Credit	Total Credit
<i>I</i>	Core Courses (Theory/Practical)			<i>Vary from 18 to 22 in each Semester (For M.sc Physics programme, since conducting practical examination in each semester is not viable, practical exams will be conducted in even semesters. Hence the total credits for the various semesters are as given under: Sem I : 16 Sem II : 22 Sem III : 16 Sem IV : 26</i>
<i>II</i>	Core Courses (Theory/Practical)		<i>For Core course total credit can vary from 60 to 68. For Elective Course total credit can vary from 12 to 20. Minimum Credit for one course shall not be less than 2 (two) and shall not exceed 5 (five).</i>	
<i>III</i>	i. Core Courses (Theory/Practical) ii. Elective Courses (Theory/Practical)			
<i>IV</i>	(i) Core Courses (Theory / Practical) including: (a) Comprehensive Viva voce (Optional) Project Work / Dissertation (ii) Elective Courses (Theory/ Practical)	<i>Teaching hours can be fixed by the concerned BoS for various courses and shall not exceed 25 hours per week @ 5 hours per day.</i>	<i>The maximum credit for comprehensive Viva voce and Project Work combined together shall be 8 (eight) subject to a minimum credit of 4 (four) for Project Work.</i>	
Total credit shall be				80

I	Audit Course I : Ability Enhancement Course (AEC)	Not coming in the normal work load	4 (Not added for SGPA / CGPA)	4
II	Audit Course II : Professional Competency Course (PCC)		4 (Not added for SGPA / CGPA)	4

c) COURSES IN VARIOUS SEMESTERS

Semester – I (16C)

- (PHY1C01) Classical Mechanics (4C)
- (PHY1C02) Mathematical Physics – I (4C)
- (PHY1C03) Electrodynamics and Plasma Physics (4C)
- (PHY1C04) Electronics (4C)
- (PHY1L01) General Physics Practical - I*
- (PHY1L02) Electronics Practical – I**
- (PHY1A01) Ability Enhancement Course (4C)

Semester – II (22C)

- (PHY2C05) Quantum Mechanics –I (4C)
- (PHY2C06) Mathematical Physics – II (4C)
- (PHY2C07) Statistical Mechanics (4C)
- (PHY2C08) Computational Physics (4C)
- (PHY2L03) General Physics Practical - II (3C)*
- (PHY2L04) Electronics Practical – II (3C)**
- (PHY2A02) Professional Competency Course (4C)

*External Practical Exam for PHY1L01 & PHY2L03 together will be conducted at the end of 2nd semester

** External Practical Exam for PHY1L02 & PHY2L04 together will be conducted at the end of 2nd semester.

Semester -III (16C)

- (PHY3C09) Quantum Mechanics – II : (4C)
- (PHY3C10) Nuclear and Particle Physics (4C)
- (PHY3C11) Solid State Physics (4C)
- Elective -I (4C)
- Project*
- (PHY3L05) Modern Physics Practical-I[#]

Semester -IV (26C)

- (PHY4C12) Atomic and Molecular Spectroscopy (4C)
- Elective -II (4C)

Elective -III (4C)

(PHY4P01)	Project(4C) [#]
(PHY4L06)	Modern Physics Practical – II (3C) ^{##}
(PHY4L07)	Computational Physics Practical (3C)
(PHY4V01)	Comprehensive Viva voce (4C)

[#]Project will be started at 3rd semester and external evaluation for PHY4P01 will be conducted at the end of 4th semester.

^{##}External Practical Exam for PHY3L05 & PHY4L06 together will be conducted at the end of 4th semester

d) CONSTITUTION OF CLUSTERS

Elective -I Cluster:

(PHY3E01)	Plasma Physics
(PHY3E02)	Advanced Quantum Mechanics
(PHY3E03)	Radiation Physics
(PHY3E04)	Digital Signal Processing
(PHY3E05)	Experimental techniques
(PHY3E06)	Elementary Astrophysics
(PHY3E07)	Introduction to Nanoscience and Technology

Elective –II Cluster:

(PHY4E08)	Advanced Nuclear Physics
(PHY4E09)	Advanced Astrophysics
(PHY4E10)	Astrophysics and Astronomical Data Analysis
(PHY4E11)	Advanced Statistical Mechanics
(PHY4E12)	Materials Science
(PHY4E13)	Electronic Instrumentation
(PHY4E14)	Laser Systems, Optical Fibres and Applications
(PHY4E15)	Communication Electronics
(PHY4E16)	Synthesis, Characterization Techniques and Applications of Nanomaterials
(PHY4E17)	Astrophysics and Positional Astronomy

Elective –III Cluster:

(PHY4E18)	Quantum Field Theory
(PHY4E19)	Chaos and Non-linear Physics
(PHY4E20)	Advanced Condensed Matter Physics
(PHY4E21)	Modern Optics
(PHY4E22)	Physics of Semiconductors
(PHY4E23)	Microprocessors, Microcontrollers and Applications
(PHY4E24)	Biophysics
(PHY4E25)	Space Physics

e) THE CREDITS AND HOURS PER WEEK

The credits and hours proposed for various courses in different semesters are as given under.

Semester	No. of Theory Papers	Practicals	Theory		Practical		Project		Seminar / Tutorial	Viva voce Credits	Total hours	Total Credits
			Hrs	Cred	Hrs	Cred	Hrs	Cred				
I	4	1. Gen. Phys I 2. Electronics I	16	16	8	0	0	0	1	0	25	16
II	4	1. Gen. Phys II 2. Electronics II	16	16	8	6	0	0	1	0	25	22
III	4	1. Mod. Phys I	16	16	4	0	4	0	1	0	25	16
IV	3	1. Mod Phys II 2. Comp. Phys	12	12	8	6	4	4	1	4	25	26
Total Credits for the Programme											80	

f) EVALUATION AND GRADING

1. Evaluation:

- i. Accumulated minimum credits required for successful completion of the course shall be 80.
- ii. A project work of 4 credits is compulsory and it should be done in III & IV semesters. Also a comprehensive Viva Voce may be conducted by external examiners at the end of IV Semester and carries 4 credits.
- iii. Evaluation and Grading : The evaluation scheme for each course shall contain two parts;
 - (a) Internal / Continuous Assessment (CA) and (b) External / End Semester Evaluation (ESE). Of the total, 20% weightage shall be given to Internal evaluation / Continuous assessment and the remaining 80% to External/ESE and the ratio of the weightage between Internal and External is **1:4**.
 - iv. Primary evaluation for Internal and External shall be based on 6 letter grades (**A+, A, B, C, D and E**) with numerical values (Grade Points) of **5, 4, 3, 2, 1 & 0**, respectively.

Grade	Grade Points
A+	5
A	4
B	3
C	2
D	1
E	0

2. Grade Point Average: Internal and External components are separately graded and the combined grade point with weightage **1** for Internal and **4** for external shall be applied to calculate the **Grade Point Average (GPA)** of each course. Letter grade shall be assigned to each course based on the categorization based on the **Ten point Scale** shown below.

The Grade Range for both Internal & External shall be:

Letter Grade	Grade Range	Range of Percentage(%)	Merit /Indicator
O	4.25 – 5.00	85.00 – 100.00	Outstanding
A+	3.75 – 4.24	75.00 – 84.99	Excellent
A	3.25 – 3.74	65.00 – 74.99	Very Good
B+	2.75 – 3.24	55.00 – 64.99	Good
B	2.50 – 2.74	50.00 – 54.99	Above Average
C	2.25 – 2.49	45.00 – 49.99	Average
P	2.00 -2.24	40.00 – 44.99	Pass
F	< 2.00	Below 40	Fail
I	0	-	Incomplete
Ab	0	-	Absent

No separate minimum is required for internal evaluation for a pass, but a minimum **P** Grade is required for a pass in the external evaluation. However, a minimum **P** grade is required for pass in a course. A student who fails to secure a minimum grade for a pass in a course will be permitted to write the examination along with the next batch.

3. Semester Grade Point Average(SGPA)

The **SGPA** is the ratio of sum of the product of the number of credits with the grade points scored by a student in all the courses taken by a student and the sum of the number of credits of all the courses taken by a student. After the successful completion of a semester, **Semester Grade Point Average (SGPA)** of a student in that semester is calculated using the formula given below.

Semester Grade Point Average - SGPA (S_i) = $\Sigma (C_i \times G_i) / Cr$ (SGPA= Total Credit Points awarded in a semester / Total credits of the semester)

where 'S_j' is the jth semester, 'G_i' is the grade point scored by the student in the ith course 'C_i' is the credit of the ith course, 'Cr' is the total credits of the semester.

4. Cumulative Grade Point Average (CGPA)

$$\text{Cumulative Grade Point Average (CGPA)} = \frac{\sum(C_i \times S_i)}{\text{Cr}} \quad (\text{CGPA} = \frac{\text{Total Credit points awarded in all semesters}}{\text{Total credits of the programme}})$$

where C_i is the credit of the ith semester S_i is the **SGPA** of the ith semester and Cr is the total number of credits in the programme. The **CGPA** is also calculated in the same manner, taking into account all the courses undergone by a student over all the semesters of a programme. The **SGPA** and **CGPA** shall be rounded off to 2 decimal points.

For the successful completion of a semester, a student should pass all courses and score a minimum **SGPA** of 2.0. However, the students are permitted to move to the next semester irrespective of their **SGPA**.

5. Evaluation of Audit Courses:

The examination and evaluation shall be conducted by the college itself either in the normal structure or MCQ model from the Question Bank and other guidelines. The Question paper shall be for minimum 20 weightage and a minimum of 2 hour duration for the examination. The result has to be intimated / uploaded to the Controller of Examinations during the Third Semester as per the notification.

g) INTERNAL EVALUATION / CONTINUOUS ASSESSMENT(CA)

This assessment shall be based on a predetermined transparent system involving periodic written tests, assignments, seminars and viva voce in respect of theory courses and based on tests, lab skill and records / viva voce in respect of practical courses. The criteria and percentage of weightage assigned to various components for internal evaluation are as follows

Theory :			
Sl.No	Component	Percentage	Weightage
1	Examination /Test	40%	2
2	Seminars / Presentation	20%	1
3	Assignment	20%	1
4	Attendance	20%	1
Practical :			
1	Lab Skill	40%	4
2	Records/viva voce	30%	3
3	Practical Test	30%	3

Grades given for the internal evaluation are based on the grades A+, A, B, C, D & E, with grade points 5, 4, 3, 2, 1 & 0 respectively. The overall grades shall be as per the Ten Point scale. There shall be no separate minimum Grade Point for internal evaluation.

Project:**Internal evaluation:**

- a) Monthly progress - wt=2
- b) Regularity and attendance -wt=1
- c) Seminar and Viva Voce- wt=1

h) PATTERN OF QUESTION PAPERS

a) Theory: Every semester Directions for question paper setters:

Part A: Set each questions to be answered in 7.5 minutes duration and should extract the critical knowledge acquired by the candidate in the subject.

Part B: 30 minutes answerable questions, each may be asked as a single question or parts.

Derivation type questions can be also asked.

Part C: 20 minutes answerable questions each and as far as possible include numerical type questions.

<i>Division</i>	<i>Type</i>	<i>No. of Questions</i>	<i>Weightage</i>	<i>Total Weightage</i>
Part A	Short Answer	8 (No Choice)	1	8
Part B	Essay	2 out of 4	5	10
Part C	Problems	4 out of 7	3	12
Total weightage for a question paper				30

Theory papers must contain at least 4 lectures plus 1 Tutorial. Project is equivalent to one theory paper (4 hours) and one practical (4 hours).

Answer to each question may be evaluated based on

- (a) Idea/knowledge – wt=1
- (b) Logic/steps – wt=1
- (c) Analytic skill – wt=1
- (d) Correctness – wt=1

b) Practical exam: At the end of II and IV semesters and each will be of 6 hours duration.

c) Project evaluation: At the end of IV semester. Its evaluation is based on:

External evaluation:

- a) Presentation-wt= 4
- b) Project Report (Novelty, Creativity & work) - wt =8
- c) Project viva voce - wt =4

d) Comprehensive Viva Voce at the end of IV semester.

(i) DETAILED SYLLABUS

SEMESTER – I

PHY1C01: CLASSICAL MECHANICS (4C, 72 hrs)

Objectives

- To learn Lagrangian and Hamiltonian formulation of mechanics.
- To learn the significance of the ideas of Lagrangian, Hamiltonian, Action, Poisson brackets, canonical transformations and their application in modified form in the formulation of quantum mechanics.
- To learn and develop the analytical and mathematical skills for describing the dynamics of rigid bodies.
- To learn the theory of small oscillations which are characteristic of all bound physical systems.
- To learn the concepts in nonlinear dynamics and chaos.

Course outcome: After completion of the full course the student should be able to	Cognitive level
C.O.1: Explain the fundamental concepts in Lagrangian and Hamiltonian formulation in mechanics.	Understand
C.O.2: Apply the concepts of Lagrangian, Hamiltonian, Action, Poisson brackets, canonical transformations and their subsequent development to Heisenberg's matrix mechanics and Schrodinger's wave mechanics, to carry out numerical problems.	Apply
C.O.3: Develop the analytical and mathematical skills for describing the dynamics of rigid bodies. It could be applied to practical situations. This can be applied spectroscopic analysis of samples.	Apply
C.O.4: Explain the theory of small oscillations. Small oscillations are part and parcel of all bound physical systems.	Understand
C.O.5: Elucidate the concepts in nonlinear dynamics and chaos. These techniques can be directly applied in nonlinear physics and also to verify various experimental results.	Apply

1. Lagrangian and Hamiltonian Formulation:

Constraints and Generalized coordinates, D'Alembert's principle and Lagrange's equation, Velocity dependent potentials, Simple applications, Hamilton's Principle, Lagrange's equation from Hamilton's principle, Kepler problem, Scattering in a central force field, Transformation to lab coordinates, Legendre Transformation, Hamilton's canonical equations, Principle of least action, Canonical transformations, examples (17 hours)

Textbook: Goldstein, Sections 1.3 – 1.6, 2.1 – 2.3, 3.10, 3.11, 8.1, 8.5, 8.6, 9.1, 9.2

2. The classical background of quantum mechanics:

Equations of canonical transformations, Examples, Poisson brackets and other canonical invariants, Equation of motion in Poisson bracket form, Angular momentum Poisson brackets, Hamilton-Jacobi equation, Hamilton's principal and characteristic function, H-J equation for the linear harmonic oscillator, Separation of variables, Action-angle variables, H-J formulation of the Kepler problem, H-J equation and the Schrödinger equation. (19hours)

Textbook: Goldstein, Sections 9.1, 9.2, 9.4 - 9.6, 10.1 – 10.5, 10.7, 10.8

3. The Kinematics and Dynamics of Rigid Bodies:

Space-fixed and body-fixed systems of coordinates, Description of rigid body motion in terms of direction cosines and Euler angles, Infinitesimal rotation, Rate of change of a vector, Centrifugal and Coriolis forces, Moment of inertia tensor, Euler's equation of motion, Force free motion of rigid bodies. (14hours)

Textbook: Goldstein, Sections 4.1, 4.4, 4.8 – 4.10

4. Small Oscillations:

Formulation of the problem, Eigenvalue equation, Eigenvectors and Eigenvalues, Orthogonality, Principal axis transformation, Frequencies of free vibrations, Normal coordinates, Free vibrations of a linear tri atomic molecule (9 hours)

Textbook: Goldstein, Sections 6.1- 6.4

5. Nonlinear Equations and Chaos:

Introduction, Singular points of trajectories, Nonlinear oscillations, Limit cycles, Chaos: Logistic map, Definitions, Fixed points, Period doubling, Universality. (13 hours)

Textbook: Bhatia, Sections 10.1, 10.2, 10.3, 10.4, 10.5, 10.51

Textbooks:

1. Herbert Goldstein "Classical Mechanics" (Addison Wesley)
2. V B Bhatia: "Classical Mechanics" (Narosa Publications,1997)

Reference books:

1. Michael Tabor: "Chaos and Integrability in Nonlinear Dynamics" (Wiley,1989)

2. N.C Rana and P.S Joag : “Classical Mechanics” (Tata McGraw Hill)
3. R.G Takwale and P.S Puranik : “Introduction to Classical Mechanics” (Tata McGraw Hill)
4. Atam P Arya: "Introduction to Classical Mechanics, (2nd Edition)" (AddisonWesley1998)
5. Laxmana : “Nonlinear Dynamics” (Springer Verlag,2001)

PHY1C02: MATHEMATICAL PHYSICS – I (4C, 72 hrs)

Objectives:

Mathematics is the language of nature. Physics addresses fundamental questions in nature. Mathematical tools used for solving physical problems constitute mathematical physics. Mathematical Physics I, offered as a core course, delivers an entry level exposure to the fundamentals of this subject.

Course outcome: After completion of the full course the student should be able to	Cognitive level
C.O.1: Describe coordinate systems appropriate for different physical problems. Applies it to solve Laplace's equation in different coordinate systems.	Analyse
C.O.2: Perform transformation operations and get the corresponding transformation matrices. Learns procedures for matrix diagonalisation.	Evaluate
C.O..3 : Distinguish the class of objects called tensors, their classifications and use. Understand differential equations of special nature and the ways to solve them.	Analyse
IC.O..4: identify differential equations of special nature and the ways to solve them.	Apply
C.O.5: Illustrate special functions as solutions to problems in atomic, molecular nuclear, and solid state physics etc. and will put them in use.	Analyse
C.O..6: Distinguish Fourier series and integral transforms of different types and their properties. This will enable him/her to analyse or solve different mathematical problems in physical sciences.	Analyse

1. Vectors:

Rotation of coordinates, Orthogonal curvilinear coordinates, Gradient, Divergence and Curl in orthogonal curvilinear coordinates, Rectangular, cylindrical and spherical polar coordinates, Laplacian operator, Laplace's equation – application to electrostatic field and wave equations, Vector integration, Enough exercises. (11 hours)

Textbook: Arfken & Weber, Sections 1.2, 1.6 - 1.9, 1.10, 2.1 – 2.5

2. Matrices and Tensors:

Basic properties of matrices (Review only), Orthogonal matrices, Hermitian and Unitary matrices, Similarity and unitary transformations, Diagonalization of matrices, Definition of Tensors, Contraction, Direct products, quotient rule, Pseudo tensors, Dual tensors, Levi Cevita symbol, irreducible tensors, Enough exercises. (11 hours)

Textbook: Arfken & Weber, Sections 3.2 - 3.5, 2.6 – 2.9

3. Second Order Differential Equations:

Partial differential equations of Physics, Separation of variables, Singular points, Ordinary series solution, Frobenius method, A second solution, Self adjoint differential equation, eigenfunctions and values, Boundary conditions, Hermitian operators and their properties, Schmidt orthogonalization, Completeness of functions, Enough exercises. (14 hours)

Textbook: Arfken & Weber, Sections 8.1, 8.3 – 8.6, 9.1 – 9.4

4. Special functions:

Gamma function, Beta function, Delta function, Dirac delta function, Bessel functions of the first and second kinds, Generating function, Recurrence relation, Orthogonality, Neumann function, Spherical Bessel function, Legendre polynomials, Generating function, Recurrence relation, Rodrigues formula, Orthogonality, Associated Legendre polynomials, Spherical harmonics, Hermite polynomials, Laguerre polynomials, Enough exercises. (24 hours)

Textbook: Arfken & Weber, Sections 10.1, 10.4, 1.15, 11.1 – 11.3, 11.7, 12.1 – 12.4, 12.6, 13.1, 13.2

5. Fourier Series:

General properties, Advantages, Uses of Fourier series, Properties of Fourier series, Fourier integral, Fourier transform, Properties, Inverse transform, Transform of the derivative, Convolution theorem, Laplace transform, Enough exercises. (12 hours)

Text: Arfken & Weber , Sections 14.1 – 14.4, 15.2 – 15.5, 15.8

Text book:

1. G.B Arfken and H J Weber: “Mathematical Methods for Physicists (5th Edition, 2001)” (Academic Press)

Course outcomes:

PHY1C03: ELECTRODYNAMICS AND PLASMA PHYSICS (4C, 72 hrs)

Objective:

- To understand Maxwell’s equations and general electromagnetic wave equations, their solutions in terms of potentials and fields, multipole expansion of the potentials and multipole moments of different orders.
- To understand propagation of electromagnetic waves through free space and the consequences of reflection from different types of boundaries.
- To understands the propagation of electromagnetic waves through confined media.
- To understands the propagation characteristics of electromagnetic waves through confined media of different types.
- To learn elementary plasma physics.

Course Outcome: After completion of the full course the student should be able to	Cognitive level
C.O.1: Explain the significance of displacement current and Maxwell’s equations and general electromagnetic wave equations, their solutions in terms of potentials and fields. Another basic concept of physics called gauge transformation will be understood. Multipole expansion of the potentials, fields and multipole moments of different orders will be learned..	Understand
C.O.2: Describe the propagation of electromagnetic waves through free space and the consequences of reflection from different types of boundaries. These have important consequences in wave propagation.	Analyse
C.O.3: Discusses propagation of electromagnetic waves through confined media like wave guides and cavity resonators.	Analyse
C.O.4: Enables to appreciate the magnificent results of the blending of relativity and electrodynamics and motivates to take up a course on quantum field theory, the study of fields, interactions and symmetries.	Analyse
C.O.5: Understand the criteria for a medium to be called plasma and the various properties of it.	Understand

1. Time varying fields and Maxwell's equations:

Maxwell's equations, Potential functions, Electromagnetic boundary conditions, Wave equations and their solutions, Time harmonic fields, Multipole expansion of electric scalar potential and magnetic vector potential, Enough exercises. (14 hours)

Textbook: Cheng, Sections 7.3 – 7.7, Griffiths, Sections 3.4, 5.4.2

2. Plane electromagnetic waves:

Plane waves in lossless media, Plane waves in lossy media, Group velocity, Flow of electromagnetic power and the Poynting vector, Normal incidence at a plane conducting boundary, Oblique incidence at a plane conducting boundary, Normal incidence at a plane dielectric boundary, Oblique incidence at a plane dielectric boundary, Enough exercises. (13hours)

Textbook: Cheng, Sections 8.2 – 8.10

3. Transmission lines, Wave guides and cavity resonators:

Transverse electromagnetic waves along a parallel plane transmission line, General transmission line equations, Wave characteristics on finite transmission lines, General wave behaviour along uniform guiding structures, Rectangular wave guides, Cavity resonators (Qualitative ideas only), Enough exercises. (14 hours)

Textbook: Cheng, Sections 9.2 - 9.4, 10.2, 10.4, 10-7.1

4. Relativistic Electrodynamics:

Magnetism as a relativistic phenomenon, Transformation of the field, Electric field of a point charge moving uniformly, Electromagnetic field tensor, Electrodynamics in tensor notation, Potential formulation of relativistic electrodynamics, Enough exercises. (15 hours)

Textbook: Griffiths, Sections 10.3.1 – 10.3.5

5. Plasma Physics:

Plasma - Definition, concepts of plasma parameter, Debye shielding, Motion of charged particles in an electromagnetic field - Uniform electric and magnetic fields, Boltzmann and Vlasov equations, their moments - Fluid equations, Plasma oscillations, Enough exercises. (16 hours)

Textbook: Chen, Sections 1.1 - 1.6, 2.2 - 2.2.2, 3.1 - 3.3.2, 4.3, 4.18, 4.19, 7.2-7.3

Text books:

1. David K. Cheng: Field and Wave Electromagnetics (Addison Wesley)

2. David Griffith: “ Introductory Electrodynamics” (Prentice Hall of India,1989)
3. F. F. Chen, Introduction to Plasma Physics and Controlled Fusion,
Volume I and II, Plenum Press, recent edition

Reference books:

1. K.L. Goswami, Introduction to Plasma Physics – Central Book House, Calcutta
2. J.D Jackso : “Classical Electrodynamics” (3rd Ed.)(Wiley,1999)

PHY1C04: ELECTRONICS (4C, 72 hrs)

Objectives:

- To learn the properties of field effect transistors and their peculiarities over bipolar transistors.
- To understand various light emitting and light sensing devices and their use for different purposes, especially microwave communication.
- To understand the fundamentals of op-amps, their characteristics and simple applications.
- To understand the basics of digital electronics by way of understanding logic gates, flip flops, registers and counters and few elementary applications.

Course Outcome: After completion of the full course the student should be able to	Cognitive level
C.O.1: Analyse characteristics of JFET and MOSFET and their specific applications.	Analyse
C.O.2: Distinguish the basic characteristics of light emitting and light sensing devices and illustrate the basic concepts behind integrating electronic and photonic devices suitably for microwave communication.	Analyse
C.O.3: Classify characteristics of op-amps and their implementation in various elementary level applications.	Analyse
C.O.4: Identify the basics of logic gates, flip flops and registers and the designing of counters, satisfying specific conditions. Understands RAM and D/A converter and basic features of specific microprocessors.	Evaluate

1. Field effect transistors

V-I characteristics of JFETs and device operation, construction of depletion and enhancement MOSFETs, V-I characteristics and device operation. Biasing of FETs, FETs as VVR and its applications, small signal model of FETs, analysis of Common Source and Common Drain amplifiers at low and high frequencies, MOSFET as a switch, CMOS and digital MOSFET gates (NOT, NAND, NOR). (10 hours)

Textbook: Integrated Electronics Millman and Halkias: Tata McGraw Hill

Reference books:

Electronic devices and Circuit theory, Robert L Boylstead & L. Nashelsky – Pearson Education
Micro Electronic Circuits: Sedra/Smith: Oxford University Press.

2. Microwave and Photonic devices

Tunnel diode, construction and characteristics, negative differential resistance and device operation, radiative transitions and optical absorption, Light emitting diodes (LED) – visible and IR, semiconductor lasers, construction and operation, population inversion, carrier and optical confinement, optical cavity and feedback, threshold current density. Photodetectors – Photoconductor (Light dependent resistor- LDR) and photodiode, p-n junction solar cells - short circuit current, fill factor and efficiency(14 hours)

Textbook: Semiconductor Devices- Physics and Technology - S.M. Sze, John Wiley and Sons
Semiconductor Optoelectronic devices: Pallab Bhattacharya: Prentice Hall

Reference: books

Principles of semiconductor devices: B. Van Zeghbroeck
Principles of semiconductor devices: S.M. Sze: John Wiley & Sons

3. Operational Amplifier

Differential amplifiers, analysis of Emitter coupled differential amplifiers, OPAMP parameters: Open loop gain, CMRR, error currents and error voltages, input and output impedances, slew rate and UGB. Frequency response, poles and zeros; transfer functions (derivation not required), expression for phase angle. Need for compensation, dominant pole, pole zero and lead compensation (12hours)

Textbook: Integrated Electronics: Millman and Halkias: Tata McGraw Hill

Reference book:

OPAMPS and Linear Integrated Circuits: Ramakant A. Gaekwad

4. OPAMP Applications

Closed loop inverting, non-inverting and difference OPAMP configurations and their characteristics; OPAMP as inverter, scale changer, summer, V to I converter, practical integrator & differentiator, active low pass, high pass and band pass Butterworth filters, band pass filter with multiple feedback, OPAMP notch filter, OPAMP Wien bridge oscillator, OPAMP astable and monostable multivibrators, Schmid triggers. (14hour)

Textbook: Integrated Electronics: Millman and Halkias : Tata McGraw Hill

OPAMPS and Linear Integrated Circuits: Ramakant A. Gaekwad

Reference books:

Linear Integrated circuits: D Roy Choudhuri : New Age International Publishers

5. Digital Electronics

Minimization of Boolean functions using Karnaugh map and representation using logic gates, JK and MS JK and D flip-flops, shift registers using D and JK flip flops and their operations, shift registers as counters, ring counter, design of synchronous and asynchronous counters, state diagram, cascade counters, basic idea of static and dynamic RAM, basics of charge coupled devices. R-2R ladder D/A

converter, Introduction to 8 bit microprocessor; internal architecture of Intel 8085 register organisation.
(22hours)

Textbooks:

1. Digital Principles and Applications: Malvino and Leach: Tata McGraw Hill
2. Digital Fundamentals: Thomas. L. Floyd: Pearson Education.
3. Fundamentals of Microprocessors and Microcomputers: B. Ram: Dhanpath Rai & Sons.

Reference books:

1. Modern Digital Electronics: R.P. Jain: Tata McGraw Hill

PHY1A01:Ability Enhancement Course (AEC) (4C)

Each student has to prepare and present a seminar on recent trends in a selected topic in physics. A report has to be prepared and submitted before presenting the seminar. The abstract of the seminar has to be sent to the head of the department through the teacher in charge.

SEMESTER – II

PHY2C05: QUANTUM MECHANICS-I (4C, 72 hrs)

Objectives

- To understand the importance of vector space, Dirac ket and bra notations, Hilbert space, operators, eigenvalue problems and generalized uncertainty principle in quantum mechanics. To understand the need for quantum mechanical formalism and the basic approaches.
- To understand time evolution of quantum mechanical systems and learn different time evolution approaches - Schrodinger picture and Heisenberg picture, wavefunction interpretation and application of different approaches in various fundamental problems.
- To develop an understanding of the mathematical foundations of spin and angular momentum for a system of particles and to apply spherical harmonics and to compute Clebsch - Gordon coefficients.
- To apply Schrodinger equation to central potential problems.
- To learn invariance principles based on symmetry of the system and the associated conservation laws and to apply quantum mechanical concepts to analyze the ground state of Helium atom.

Course Outcome: After completion of the full course the student should be able to	
C.O.1: Appreciate the importance and implication of vector spaces. Will be able to use Dirac ket and bra notations. Use operators and will be able to solve eigen value problems. Understand generalized uncertainty principle in quantum mechanics and the need for quantum mechanical formalism and its basic principles.	Understand
C.O.2: Explain time evolution of quantum mechanical systems and learn different time evolution approaches -Schrodinger picture and Heisenberg picture. Apply different approaches in quantum dynamics to various fundamental problems.	Apply
C.O.3:Develop a better understanding of the mathematical foundations of spin and angular momentum. Make use of spherical harmonics to compute Clebsch - Gordon coefficients.	Evaluate
C.O.4: Apply Schrodinger’s equation to central potentials problems, to solve various quantum mechanical problems.	Apply
C.O.5: Understand invariance principles based on symmetry of the system and establish the associated conservation laws. These quantum mechanical concepts will be applied to analyse the ground state of Helium atom. Here it will be understood that all symmetry elements possess the mathematical property of groups.	Understand

1. Formulation of Quantum Mechanics

Sequential Stern-Gerlach experiments – Analogy with the polarization of light – Need for representing a quantum mechanical state as a vector in complex vector space. Dirac notation – Ket space, Bra space and Inner products – Operators – Hermitian adjoint – Hermitian operator – Multiplication – Associative axiom – Outer product.

Eigenkets and eigenvalues of Hermitian operator – Eigenkets as base kets – Completeness relation – Projection operator – Matrix representation of operators, kets and bras. Measurement in a quantum mechanical system – Expectation value – Illustration with spin-1/2 systems – Compatible observables and simultaneous eigenkets – Maximal set of commuting observables – Incompatible observables and general uncertainty relation. Unitary operator – Change of basis and transformation matrix – Similarity transformation – Diagonalization – Unitary equivalent observables. Position eigenkets and position measurements – Infinitesimal translation operator and its properties – Linear momentum as a generator of translation – Canonical commutation relations. Position-space wavefunction – wavefunction as an expansion coefficient – Momentum operator in the position basis – Momentum-space wavefunction – Transformation function or the momentum eigenfunction in position basis – Relations between wavefunctions in position-space and momentum-space. Gaussian wave packet – Computation of dispersions of position operator and momentum operator – Minimum uncertainty product. Generalization to three dimensions. (20 hours)

Textbook: Chapter 1, Modern Quantum Mechanics (Edn.2) by J. J. Sakurai

2. Quantum Dynamics

Time-evolution operator – Schrodinger equation for the time-evolution operator and its solutions according to the time-dependence of the Hamiltonian operator – Energy eigenkets – Time dependence of expectation values – Time evolution of a spin-1/2 system and Spin precession – Correlation amplitude and energy-time uncertainty relation. Schrodinger picture and Heisenberg picture – Behaviour of state kets and observables in Schrodinger picture and Heisenberg picture – Heisenberg equation of motion – Ehrenfest's theorem. Time-evolution of base kets and transition amplitudes. Simple harmonic oscillator – energy eigenkets and energy eigenvalues – Dirac's method – Time development of the oscillator. Schrodinger's wave equation – Time-dependent wave equation – Time-independent wave equation – Continuity Equation – Interpretations of the wavefunction – Classical limit of wave mechanics. Boundary conditions – Elementary solutions to Schrodinger's wave equation – Free particle in one dimension and three dimensions – Simple harmonic oscillator – Particle in a one-dimensional box – Particle in a finite potential well – One-dimensional potential step – Square potential barrier. (20 hours)

Textbooks: (1) Chapter 2 – upto section 2.5, Modern Quantum Mechanics (Edn.2) by J. J. Sakurai

(2) Chapter 4 – section 4.3, Quantum Mechanics (Edn.4) by V. K. Thankappan

3. Theory of Angular Momentum

Non-commutative nature of rotations around different axes – Rotation operator – Infinitesimal rotations in quantum mechanics – Fundamental commutation relations for angular momentum operators. Rotation operators for spin-1/2 systems – Spin precession in a magnetic field – Pauli's two component formalism – Representation of the rotation operator as 2×2 matrix. Ladder operators and their commutation relations – Eigenvalue problem

for angular momentum operators J^2 and J_z —Matrix elements of angular momentum operators and rotation operator. Orbital angular momentum – Orbital angular momentum as generator of rotation – Spherical harmonics – Spherical harmonics as rotation matrices. Addition of orbital angular momentum and spin angular momentum – Addition of angular momenta of two spin-1/2 particles – Formal theory of Angular Momentum addition – Computation of Clebsch-Gordan coefficients – Clebsch-Gordan coefficients and the rotation matrices. (15hours)
Text : Chapter 3 – sections 3.1, 3.2, 3.5, 3.6 and 3.8, Modern Quantum Mechanics (Edn.2) by J. J. Sakurai

4. Central Potentials

Schrodinger's equation for central potentials – The radial equation – Particle in an infinite spherical well – Isotropic harmonic oscillator – The Coulomb potential and the hydrogen atom problem. (8 hours)

Textbook: Chapter 3 – section 3.7, Modern Quantum Mechanics (Edn.2) by J. J. Sakurai.

5. Invariance Principles and Conservation Laws

Symmetry and conservation laws –Space-time symmetries – Displacement in space and conservation of linear momentum – Displacement in time and conservation of energy – Rotation in space and conservation of angular momentum – Space inversion and conservation of parity – Time reversal symmetry. The indistinguishability principle – Symmetric and antisymmetric wavefunctions – Eigenvalues and eigenvectors of particle-exchange operator – Spin and statistics – Pauli's exclusion principle and antisymmetric wavefunction – The ground state of Helium atom. (9hours)

Textbook: Chapter 6 and 9 – relevant sections, Quantum Mechanics (Edn.4) by V. K. Thankappan

Textbooks:

1. Modern Quantum Mechanics (Edn.2) J. J. Sakurai, Pearson Education.
2. Quantum Mechanics (Edn.4): V. K. Thankappan, New Age International

PHY2C06: MATHEMATICAL PHYSICS-II (4C, 72 hrs)

Objectives:

- To provide the basic ideas of Complex variables, Cauchy's integral theorem, Taylor's and Laurent's theorems, and by the evaluation of the residues of complex functions.
- To introduce students to group theory.
- To understand the basic concepts of calculus of variation, which is widely used in different areas of physics.
- Introduce Greens function to develop expertise in solving equations showing causality relationships.

Course Outcome: After completion of the full course the student should be able to	
C.O.1: In general, physical phenomena are expressed in equations involving complex quantities. Some times we get complex solutions to equations. Solving such problems requires special procedures. On completing this module he/she will be gain the skill for solving and interpreting such problems.	Analyse
C.O.2: Acquire a preliminary training in group theory. All symmetry elements possess the mathematical property of groups. Concepts of group theory will help to solve problems in quantum mechanics. It is quantum mechanics that gives more stress on symmetry than classical mechanics.	Apply
C.O.3: Apply the techniques of calculus of variation to diverse problems in physics.	Apply
C.O.4: Apply the Greens function technique to solve problems showing causality relationships.	

1. Functions of Complex Variables

Introduction, Analyticity, Cauchy-Reimann conditions, Cauchy's integral theorem and integral formula, Laurent expansion, Singularities, Calculus of residues and applications (15 hours)-

Textbook: Sections 6.1 to 6.5, 7.1, 7.2

2. Group Theory

Groups, multiplication table, conjugate elements and classes, subgroups, direct product groups, isomorphism and homomorphism, permutation groups, distinct groups of given order, reducible and irreducible representations.

Textbook; Sections 1-1.8, Joshi.

Generators of continuous groups, rotation groups $SO(2)$ and $SO(3)$, rotation of functions and angular momentum, $SU(2)$ - $SO(3)$ homomorphism, $SU(2)$ isospin and $SU(3)$ eight fold way (20hours)

Textbook: Sections 4.2, Arfken 5th edition.

3. Calculus of Variations

One dependent and one independent variable, Applications of the Euler equation, Generalization to several independent variables, Several dependent and independent variables, Lagrange Multipliers, Variation subject to constraints, Rayleigh-Ritz variational technique. (14 hours)

Textbook : Sections 17.1 to 17.8

4. Integral equations

Integral equations- introduction, Integral transforms and generating functions, Neumann series, separable kernel (12 hours)

Textbook: Sections 16.1 to 16.3

5. Green's function

Green's function, eigenfunction expansion, 1-dimensional Green's function, Green's function integral-differential equation, eigenfunction, eigenvalue equation Green's function and Dirac delta function, Enough exercises (11 hours)

Textbook: Section 9.51

Text books:

1. G.B.Arftken and H.J. Weber: "Mathematical Methods for Physicists (5th Edition, 2001)" (AcademicPress)
2. A. W Joshi, Elements of Group theory for Physicists (New Age International(P) Ltd)

PHY2C07: STATISTICAL MECHANICS (4C, 72 hrs)

Objectives:

- To provide an understanding of the concepts of different ensemble theories to explain the behavior of systems.
- To provide an understanding of the difference between classical statistics and quantum statistics.
- To provide an understanding of the statistical behavior of Bose-Einstein and Fermi-Dirac systems

Course Outcome : After completion of the full course the student should be able to	Cognitive level
C.O.1: Understand macroscopic and the microscopic states, thermodynamic potentials, basic concepts of entropy, Liouville's theorem and its consequences. Also the students will have an understanding of the connection between statistics and thermodynamics.	Understand
C.O.2: Have a detailed understanding different canonical ensembles.	Understanding
C.O.3: Develop an understanding of the statistical behavior of Bose-Einstein and Fermi-Dirac systems.	Understanding

1. The Statistical Basis of Thermodynamics

The macroscopic and the microscopic states – Contact between statistics and Thermodynamics: Expressing T, P and μ in terms of Ω – The classical Ideal gas - The entropy of mixing and the Gibbs paradox - Phase space of a classical system - Liouville's theorem and its consequences. (13 Hours)

Text book: Pathria, Sections 1.1 – 1.6, 2.1 – 2.2

2. Microcanonical, Canonical and Grand Canonical Ensembles

The microcanonical ensemble – Examples : (1) Classical Ideal gas, (2) Linear harmonic oscillator - Quantum states and the phase space – Equilibrium between a system and a heat reservoir- Physical significance of the various statistical quantities in the canonical ensemble- Alternative expressions for the partition function- Examples: (1) The classical systems: Ideal gas, (2) A system of harmonic oscillators, (3) The statistics of paramagnetism - Energy fluctuations in the canonical ensemble -Equipartition theorem - Virial theorem - Equilibrium between a system and a particle-energy reservoir- Physical significance of the various statistical quantities in the grand canonical ensemble- Example : Classical Ideal gas - Density and energy fluctuations in the grand canonical ensemble. (21 Hours)

Textbook: Pathria, Sections 2.3 -2.5, 3.1, 3.3 - 3.9, 4.1, 4.3 – 4.5

3. Formulation of Quantum Statistics

Quantum-mechanical ensemble theory: The density matrix- Statistics of the various ensembles-Example: An electron in a magnetic field - Systems composed of indistinguishable particles- An ideal gas in a quantum-

mechanical microcanonical ensemble- An ideal gas in other quantum-mechanical ensembles-Statistics of the occupation numbers (15 Hours)

Textbook: Pathria, Sections 5.1 - 5.4, 6.1 – 6.3

4. Ideal Bose Systems

Thermodynamic behaviour of an ideal Bose gas- Thermodynamics of the blackbody radiation- The field of sound waves. (10Hours)

Textbook : Pathria, Section : 7.1 – 7.3

5. Ideal Fermi Systems

Thermodynamic behaviour of an ideal Fermi gas- Magnetic behaviour of an ideal Fermi Gas: (1) Pauli paramagnetism, (2) Landau diamagnetism – The electron gas in metals (Discussion of heat capacity only), Enough exercises. (13 Hours)

Textbook: Pathria, Section : 8.1 – 8.3

Textbook:

1. Statistical Mechanics (2nd Edition), R. K. Pathria , Butterworth-Heinemann /Elsevier(1996)

Reference books:

1. Statistical Mechanics: An Elementary Outline, Avijit Lahiri, Universities Press (2008)
2. An Introductory Course of Statistical Mechanics, Palash. B. Pal, Narosa (2008)
3. Statistical Mechanics: An Introduction, Evelyn Guha, Narosa (2008)
4. Statistical and Thermal Physics: An Introduction, S. Lokanathan and R.S.Gambhir, Prentice Hall of India(2000).
5. Introductory Statistical Mechanics (2nd Edition), Roger Bowley and Mariana Sanchez, Oxford University Press (2007)
6. Concepts in Thermal Physics, Stephen. J. Blundell and Katherine. M. Blundell, Oxford University Press (2008)
7. An Introduction to Thermal Physics, Daniel. V. Schroeder, Pearson (2006)
8. Statistical Mechanics, Donald. A. McQuarrie, Viva Books (2005)
9. Problems and Solutions on Thermodynamics and Statistical Mechanics, Ed. by Yung – Kuo Lim, Sarat Book House (2001)

Basic Thermodynamics Video Prof. S.K. Som IIT Kharagpur

<http://nptel.iitm.ac.in/video.php?subjectId=112105123>

PHY2C08: COMPUTATIONAL PHYSICS (4C, 72 hrs)

Objectives:

- To learn the basic concepts of computer programming using Python language.
- To learn the use of necessary modules in python language for doing advanced mathematical calculations and visualizations.
- Learn the use of numerical techniques and implement them for solving mathematical problems like interpolation, curve fitting, integration etc.
- Learn the techniques for solving mathematical problems like solution of differential equations, finding Fourier transforms etc. numerically, using computers.
- Learn the basic concepts of solving diverse problems in physics by computer simulation using python language.

Course Outcome: After completion of the full course the student should be able to	
C.O.1: Write computer programs using core python	Create
C.O.2: Use advanced mathematical modules like Numpy and Pylab in python program for solving mathematical and physical problems and also to present the result visually using graphs and charts.	Apply
C.O.3: Solve numerically mathematical problems like interpolation, curve fitting, integration etc. and to write python programs for these.	Apply
C.O.4: Solve numerically mathematical problems like differential equations, Fourier transforms etc. and also to write python program for these.	Apply
C.O.5: Analyse by simulating simple physical problems in physics like one-dimensional and two-dimensional motion, harmonic oscillator, radio active disintegration, chaos, solution of Schrodinger equation etc., using python programs by applying the knowledge acquired for the course.	Analyse

1. Introduction to Python Programming

Concept of high level language, steps involved in the development of a Program - Compilers and Interpreters - Introduction to Python language: Inputs and Outputs, Variables, operators, expressions and statements - Strings, Lists, Tuples, and Dictionaries, Conditionals, Iteration and looping, Functions and Modules -. Mathematical functions (math module), File input and Output, Pickling Formatted Printing. (13hours)

2. Tools for maths and visualisation in Python (The numpy and pylab modules)*

Numpy module:- Arrays and Matrices – creation of arrays and matrices (arange, linspace, zeros, ones, random, reshape, copying), Arithmetic Operations, cross product, dot product , Saving and Restoring, Matrix inversion, solution of simultaneous equations, Data visualization- The Matplotlib, Module- Plotting graphs, Multiple plots, .Polar plots, Pie Charts, Plotting mathematical functions, Sine and other functions, Special functions – Bessel & Gamma, Fourier Series. (13 hours)

3. Numerical Methods 1*

Interpolation: linear and polynomial interpolation, equidistant points - Newton's forward/backward difference, spline interpolation. Curve fitting- Least square fit- linear and exponential. Derivatives: Lagrange polynomials, Newton difference polynomials, finite difference approximations. Numerical integration: simple quadratures (trapezoid, Simpson). Solution of non-linear equations: closed domain methods (bisection and regula falsi. Monte Carlo Method –Simple Integration. (15hours)

4. Numerical Methods-2*

Ordinary differential equations: Initial value problems: the first-order Euler method, the second-order single point methods (predictor), Runge-Kutta methods. Boundary value problems: the shooting method, the equilibrium method, the Numerov's method, the eigenvalue problems - the equilibrium method. Fourier transforms: discrete Fourier transforms, fast Fourier transforms. (15hours)

5. Computational methods in Physics and Computer simulations 12 hrs (24marks)*

Classical Mechanics: One Dimensional Motion: Falling Objects: Introduction – Formulation: from Analytical methods to Numerical Methods - Euler Method, Freely falling body, Fall of a body in viscous medium, Two dimensional motion: Projectile motion (by Euler method) and Planetary motion (R-K Method), Accuracy considerations, -, Oscillatory motion – Ideal Simple Harmonic Oscillator (Euler method), Motion of a damped oscillator (Feynmann-Newton method), Logistic maps. Monte-Carlo simulations: value of π , simulation of radioactivity. Quantum Mechanics: 1D Schrodinger equation – wave function and eigenvalues. (16hours)
(Visualisation can be done with matplotlib/pylab)

*(Programs are to be discussed in Python)

Textbooks for Numerical Methods:

1. Introductory methods of numerical analysis, S.S. Shastry , (Prentice Hall of India,1983)
2. Numerical Methods in Engineering and Science, Dr. B S Grewal, Khanna Publishers, New Delhi (or any other book)
3. Numerical Mathematical Analysis, J.B Scarborough

PHY2A02 Professional Competency Course (PCC) (4C) (See item 4 in section (a))

Latex – scientific document preparation system: Downloading and installing a LATEX distribution, Basic types of LATEX documents, Packages and use of package physics, Format words, lines, paragraphs and pages, Create lists, tables, figures and captions, Citing books and journals.

Typeset complicated equations and formulas, inserting centered and numbered equations and aligning multi-line equations, typesetting mathematical symbols such as roots, arrows, Greek letters, and different mathematical operators, math structures such as fractions and matrices. Enhance the documents by bringing color.

Activities :

1. Typeset a model question paper for M.Sc programme
2. Develop a review paper in a format suitable for the journal “Pramana – Journal of Physics”
3. Create a professional presentation using beamer

References: 1. A document preparation system – Latex: User’s guide and Reference manual, 2nd ed.. Leslie Lamport, Pearson Education

2. student’s guide to the study, practice and tools of modern mathematics, Donald Bindner and Martin Erickson, CRC Press

Evaluation of this will be based on a multiple choice written examination and an internal practical.

OR

A short course on General Theory of Relativity (4C) (See item 4 in section (a))

Module I*

Principle of equivalence, curvature of space-time, geodesic, Einstein’s field equation and its solution (qualitative only)

Important Consequences : Black hole, Gravitational redshift, bending of light beam, deviation of perihelion of mercury

Module II

Prepare a review of the Major contributions of Stephen Hawking and Roger Penrose.

Activities :

1. Write a review of Journal paper in the field of general theory of relativity.
2. Create a presentation based on this review.

References :

1. Gravity: An Introduction to Einstein's General Relativity- James B Hartle- Addison-Wesley, San Francisco, 2003.
2. The Large Scale Structure of Space-Time"- Stephen Hawking - Cambridge University Press, 1973

**Evaluation of this will be based on a written examination*

Practical for Semester I & II

a) PHY1L01 & PHY2L03 (GENERAL PHYSICS)

External Practical Exam for PHY1L01 & PHY2L03 together will be conducted at the end of 2nd semester

Note :

1. All the experiments should involve error analysis. Internal evaluation to be done in the respective semesters and grades to be intimated to the controller at the end of each semester itself. Practical observation book to be submitted to the examiners at the time of examination.
2. Eight experiments are to be done by a student in a semester. One mark is to be deducted from internal marks for each experiment not done by the student if the required total of experiments are not done in the semesters.
3. The PHOENIX/EXPEYES Experimental Kit developed at the Inter University Accelerator Centre, New Delhi, may be used for the experiments wherever possible.

(At least 16 experiments should be done, 8 each for I & II semesters)

1. λ and σ - Interference method (a) elliptical (b) hyperbolic fringes. To determine λ and σ of the material of the given specimen by observing the elliptical and hyperbolic fringes formed in an interference setup
2. λ & σ by Koenig's method
3. Variation of surface tension with temperature - Jaegar's method. To determine the surface tension of water at different temperatures by Jaegar's method of observing the air bubble diameter at the instant of bursting inside water
4. Stefan's constant-To determine Stefan's constant
5. Thermal conductivity of liquid and air by Lee's disc method.
6. Dielectric constant by Lecher wire- To determine the wave length of the waves from the given RF oscillator and the dielectric constant of the given oil by measurement of a suitable capacitance by Lecher wire setup.
7. Viscosity of a liquid - Oscillating disc method. To determine the viscosity of the given liquid by measurements on the time period of oscillation of the disc in air and in the liquid
8. Mode constants of a vibrating strip. To determine the first and second mode constants of a steel vibrating strip; λ to be measured by the Cantilever method and frequency of vibration by the Melde's string method.
9. Constants of a thermocouple and temperature of inversion.
10. Study of magnetic hysteresis - B-H Curve using standard toroid / specimen in any form.
11. Maxwell's L/C bridge -To determine the resistance and inductance of the given unknown inductor by Maxwell's L/C bridge OR Anderson's Bridge – L/C and self-inductance. (The kit developed by Indian Academy of Science can also be used)
12. Susceptibility measurement by Quincke's and Guoy's methods - Paramagnetic susceptibility of salt and specimen
13. Michelson's interferometer - (a) λ and (b) $d \lambda$ and thickness of mica sheet.
14. Photoelectric effect. Determination of Planck's constant
15. Frank Hertz experiment- To measure the ionization potential of Mercury by drawing current versus applied voltage.
16. Fabry Perot etalon - Determination of thickness of air film.
17. Elementary experiments using Laser: (a) Study of Gaussian nature of laser beam (b) Evaluation of beam spot size (c) Measurement of divergence (d) Diameter of a thin wire
18. Diffraction Experiments using lasers (a) Diffraction by single slit/double slit/circular aperture (b) Diffraction by reflection grating
19. Measurement of the thermal and electrical conductivity of Cu to determine the Lorentz number (The kit developed by Indian Academy of Science can also be used)

20. Passive filters.(The kit developed by Indian Academy of Science can also be used)
21. Microwave experiments - Determination of wavelength, VSWR, attenuation, dielectric constant.
22. Experiments with Lock-in Amplifier(a) Calibration of Lock In Amplifier (b) Phase sensitive detection (c) Mutual inductance determination (d) Low resistance determination (The kit developed by Indian Academy of Science can also be used)
23. Cauchy's constants using liquid prism
24. Forbe's method of determining thermal conductivity
25. Zeeman effect using Fabry-Perot etalon.

7. K.Muraleedhara Varier, A Practical Approach to Nuclear Physics, Narosa Publishing House(2018)

b) PHY1L02 & PHY2L04(ELECTRONICS)
(At least 16 experiments should be done, 8 each for I& II semesters.)

External Practical Exam for PHY1L02 & PHY2L04 together will be conducted at the end of 2nd semester.

1. Study the V-I characteristics of a Silicon Controlled Rectifier – Construct half-wave and full-wave circuits using SCR.
2. a). Study the V-I characteristics of UJT. Determine intrinsic stand-off ratio. Design and construct a relaxation oscillator and sharp pulse generator for different frequencies.
 b). Design and construct a time delay circuit to switch ON a suitable load driven by a SCR. Trigger the SCR using UJT.
3. a).Study the V-I characteristics of a JFET. Determine pinch-off voltage, saturation drain current and cut-off voltage of the device.
 b). Design and construct a low frequency common source amplifier using JFET. Study the frequency response, measure the i/p and o/p impedances.
- 4.Design and construct a d.c voltage regulator using transistors and Zener diode. Study the line and load regulation characteristics for suitable o/p voltage and maximum load current.
5. Design a single stage bipolar transistor amplifier. Compare the characteristics and performance of the circuit without feedback and with a suitable negative feedback. Compare theoretical and observed magnitudes of voltage gain, i/p and o/p impedances in both cases.
6. Design and construct a differential amplifier using transistors. Study frequency response and measure i/p, o/p impedances. Also measure CMRR of the circuit.
7. a) Design and construct an amplitude modulator circuit. Study the response for suitable modulation depths. b) Design and construct a diode A.M detector circuit to recover the modulating signal from the A. M wave.
8. Design and construct two stage I.F amplifier circuit. Study the response of single and coupled stages.
9. Design and construct a Darlington pair amplifier using medium power transistors for a suitable output current. Study the frequency response of the circuit and measure the i/p and o/p impedances.
- 10.Design and construct a piezo-electric crystal oscillator to generate square waves of suitable frequencies. Compare designed and observed frequencies.
- 11.Design and construct an R.F oscillator using tunnel diode. Measure frequency of the output signal.
- 12.Design and construct OPAMP based summing and averaging amplifier for three suitable inputs. Compare the designed and observed outputs.

13. Design and construct a Wien bridge oscillator using OPAMP for different frequencies. Compare designed and observed frequencies.
14. Design and construct an astable multivibrator using OPAMP for suitable frequencies.
15. Design and construct a monostable multivibrator using OPAMP for suitable pulse widths.
16. Design and construct a triangular wave generator using OPAMPs for different frequencies.
17. Design and construct OPAMP based precision half and full wave rectifiers. Observe the o/p on CRO and study the circuit operation.
18. Design and construct an astable multivibrator using timer IC 555. Measure frequency and duty cycle of the o/p signal. Modify the circuit to obtain almost perfect square waves.
19. Design and construct a monostable multivibrator using timer IC 555, for different pulse widths. Compare designed and observed pulse widths.
20. Design and construct a voltage controlled oscillator using timer IC 555. Study the performance.
21. Design and construct Schmidt triggers using OPAMPs – for symmetrical and non-symmetrical LTP/UTP. Trace hysteresis curve.
22. Design and construct OPAMP based analogue integrator and differentiator. Study the response in each case.
23. a). Design and construct OPAMP based circuit for solving a second order differential equation. Study the performance.
b). Design and construct OPAMP based circuit for solving a simultaneous equation. Study the performance.
24. Design and construct Second order Butterworth Low pass, High Pass and Band Pass filters using OPAMPs. Study the performance in each case.
25. Design and construct a narrow band-pass filter for a given centre frequency using a single OPAMP with multiple feedback. Study the frequency response.
26. 4 bit D/A converter using R-2R ladder network. Realization of 4 bit A/D converter using D/A converter.
27. Study of 4 bit binary counter (IC 7493) and 4 bit decade counter (IC 7490) at various modes. Use the counters as frequency dividers.
28. Design and construct a 3 bit binary to decimal decoder using suitable logic gates. Verify the operation.
29. Set up four bit shift register IC 7495 and verify right shift and left shift operations for different data inputs.

References: Design and construction ideas may be obtained from standard electronics text books.

SEMESTER – III

PHY3C09: QUANTUM MECHANICS –II (4C, 72 hrs)

Objectives:

- To understand time independent perturbation theory and apply it to different quantum mechanical systems.
- To apply methods like Ritz variational technique and WKB approximation to quantum mechanical systems.
- To understand the time dependent perturbation theory and apply to different quantum mechanical systems.
- To understand theory of scattering and the partial wave analysis.
- To understand the need for relativistic quantum mechanics and the derivation of various relativistic wave equations and their interpretations.

Course Outcome: After completion of the full course the student should be able to	Cognitive level
C.O.1: Understand time independent perturbation theory and to apply it to harmonic and anharmonic oscillators, and learn the fine structure and hyperfine splitting of Hydrogen atom in the presence of external magnetic and electric fields.	Understanding Apply
C.O.2: Apply methods like Ritz variational technique and WKB approximation to quantum mechanical systems.	Apply
C.O.3: Interpret time dependent perturbation theory and apply it to describe radiative transitions in atoms. Understand Fermi's Golden rule and learn Born approximation.	Analyse Apply
C.O.4: Explain the theory of scattering and apply the method of partial waves to scattering by central potential and square well potential.	Understand
C.O.5: Identify the principles of relativistic quantum mechanics and apply to Dirac particles, Klein-Gordon equation. Also understand the concept of spinors and the non-relativistic limit and Hole theory.	Apply

1. Time-Independent Perturbation Theory

Non-degenerate perturbation theory – First-order theory and Second-order theory – Examples : (1) Linear harmonic oscillator (2) Anharmonic oscillator – Degenerate perturbation theory – Two-fold degeneracy – Higher-order degeneracy – The fine-structure of hydrogen – Relativistic correction – Spin-orbit coupling - Zeeman effect – Weak-field Zeeman effect – Strong-field Zeeman effect – Intermediate-field Zeeman effect – Hyperfine splitting – Linear Stark effect in the hydrogen atom. (20Hrs.)

Text : (1) Chapter 6, Introduction to Quantum Mechanics (Edn.2) by David. J. Griffiths,
(2) Chapter 8, section 8.3, Quantum Mechanics (Edn.4) by V. K. Thankappan

2. Variational Method and WKB Method

Bound states (Ritz method) – Linear harmonic oscillator – Helium atom – WKB wavefunction in classical region – Example : Potential well with two vertical walls – WKB wavefunction in nonclassical region – Example : Tunneling – Connection formulae – Examples : (1) Potential well with one vertical wall (2) Potential well with no vertical walls. (12Hrs.)

Text : (1) Chapter 8, section 8.2A, Quantum Mechanics (Edn.4) by V. K. Thankappan
(2) Chapter 6, Introduction to Quantum Mechanics (Edn.2) by David. J. Griffiths

3. Time-dependent perturbation theory

First order time-dependent perturbation theory – Constant perturbation – Transition to a continuum – Fermi's Golden rule – Scattering cross section in the Born approximation – Harmonic perturbation – Radiative transitions in atoms. (12Hrs.) (12Hrs.)

Text: Chapter 8, sections 8.4, 8.4A, 8.4B, Quantum Mechanics (Edn.4) by V. K. Thankappan

4. Scattering

Scattering amplitude – Method of partial waves – Scattering by a central potential – Optical theorem – Scattering by a square-well potential (12Hrs.)

Text: Chapter 7, relevant sections, Quantum Mechanics (Edn.4) by V. K. Thankappan

5. Relativistic Quantum Mechanics

Klein-Gordon equation – First order wave equations – Weyl equation – Dirac equation – Properties of Dirac matrices – Dirac particle is spin-1/2 particle – Spinor – Equation of continuity – Dirac particle in an external magnetic field : Non- relativistic limit – Hole theory (16Hrs.)

Text: Chapter 10, relevant sections; Quantum Mechanics (Edn.4) by V. K. Thankappan

Textbooks:

1. Quantum Mechanics (Edn. 4) :V. K. Thankappan, New Age International.
2. Introduction to Quantum Mechanics (Edn. 2) : D.J. Griffiths, Pearson Education.

PHY3C10: NUCLEAR AND PARTICLE PHYSICS (4C, 72 hrs)

Objectives

- To understand the basic properties of a nucleus, fundamentals of nucleon scattering and derive the information regarding deuteron structure.
- To understand different decay modes of unstable nuclei and to estimate the related parameters.
- Understand various nuclear models and nuclear processes like fission and fusion.
- Understand the working of radiation detectors and the associated nuclear electronics.

Course Outcome: After completion of the full course the student should be able to	Cognitive level
C.O.1: Interpret the properties of nucleus, binding energy, angular momentum, two nucleon scattering, spin dependence, tensor force, partial wave concept and the theory of deuteron structure.	Analyse
C.O.2: Elucidate the theory of various types of nuclear decay, selection rules of transition, concept of parity and multipole moments.	Understand
C.O.3: Compare various nuclear models and nuclear processes like fission and fusion. Will be able to apply it to various nuclear systems in the chart of nuclides.	Analyse
C.O.4: Demonstrate the working of one or two nuclear radiation detectors of different types and the signal processing and analysing units.	Apply
C.O.5: Compare basic interactions and classify the elementary particles. Interactions are linked with the concept of symmetry and conservation laws. Understand Sakata model, Gellmann- Okubo mass formula, Quark mode and their significance.	Analyse

1. Nuclear Forces

Properties of the nucleus, size, binding energy, angular momentum, The deuteron and two- nucleon scattering experimental data, Simple theory of the deuteron structure, Low energy n-p scattering, characteristics of nuclear forces, Spin dependence, Tensor force, Scattering cross sections, Partial waves, Phase shift, Singlet and triplet potentials, Effective range theory, p-p scattering. (12hours)

Textbook: K.S.Krane : “Introductory Nuclear Physics” (Wiley), (Ch. 3 and 4)

2. Nuclear Decay

Basics of alpha decay and theory of alpha emission, Beta decay, Energetics of beta decay, Fermi theory of beta decay, Comparative half-life, Allowed and forbidden transitions, Selection rules, Parity violation in beta decay. Neutrino. Energetics of Gamma Decay, Multipole moments, Decay rate, Angular momentum and parity selection rules, Internal conversion, Life times. (12hours)

Textbook: K.S.Krane : “Introductory Nuclear Physics” (Wiley), (Ch. 8, 9 and 10)

3. **Nuclear Models, Fission and Fusion**

Shell model potential, Spin-orbit potential, Magnetic dipole moments, Electric quadrupole moments, Valence Nucleons, Collective structure, Nuclear vibrations, Nuclear rotations, Liquid drop Model, Semiempirical Mass formula, Energetics of Fission process, Controlled Fission reactions. Fusion process, Characteristics of fusion, solar fusion, Controlled fusion reactors. (19hours)

Textbook: K.S.Krane : “Introductory Nuclear Physics” (Wiley), (Ch. 5,13.1-13.5,14)

4. **Nuclear Radiation Detectors and Nuclear Electronics**

Gas detectors – Ionization chamber, Proportional counter and G M counter, Scintillation detector, Photomultiplier Tube (PMT), Semiconductor detectors – Ge(Li), Si(Li) and surface barrier detectors, Preamplifiers, Amplifiers, Single channel analyzers, Multi- channel analyzers, counting statistics, energy measurements. (12hours)

Textbook: S S Kapoor and V S Ramamurthy: “Nuclear Radiation Detectors” (Wiley)

5. **Particle Physics**

Four basic forces - Gravitational, Electromagnetic, Weak and Strong - Relative strengths, classification of particles, Yukawa's theory, Conservation of energy and masses, Electric charges, Conservation of angular momentum, Baryon and lepton numbers, Conservation of strangeness, Conservation of isospin and its components, Conservation of parity, Charge conjugation, CP violation, time reversal and CPT theorem. Extremely short lived particles, Resonances - detecting methods and experiments, Internal symmetry, The Sakata model, SU(3), The eight fold way, Gellmann and Okubo mass formula, Quarks and quark model, Confined quarks, Experimental evidence, Coloured quarks. (17hours)

Textbook: Y. Neeman and Y. Kirsh: ‘The particle hunters’ (Cambridge University Press), Ch 6.1- 3, 3.4, 7.1-10, 8.1, 9.1-7)

Reference Books:

1. H.S.Hans :“Nuclear Physics – Experimental and theoretical” (New Age International,2001).
2. G.F.Knoll : “Radiation Detection and Measurement, (Fourth Edition, Wiley,2011)
3. G.D.Coughlan, J.E.Dodd and B.M.Gripalos “The ideas of particle physics –an introduction for scientists”, (CambridgePress)
4. David Griffiths – “Introduction to elementary particles” – Wiley(1989)
5. S.B. Patel: “An Introduction to Nuclear Physics” (New Age International Publishers)
6. Samuel S.M.Wong: “Introductory Nuclear Physics” (Prentice Hall, India)
7. B.LCohen : “Concepts of Nuclear Physics” (Tata McGraw Hill)
8. E.Segre : “Nuclei and Particles” (Benjamin,1967)
9. K Muraleedhara Varier: “Nuclear Radiation Detection: Measurement and Analysis” (Narosa Publishing House, Calcutta)

PHY3C11: SOLID STATE PHYSICS (4C, 72 hrs)

Objectives:

- To understand the reciprocal lattice, Brillouine zone, crystal structures and various bondings in crystals.
- To understand different excitations in crystals and their after effects.
- To understand free electron model and the explanation for the properties of metals. To have a deeper understanding of band gaps in different situations.
- To understand the thermal, electrical and magnetic properties of matter.
- To understand electron pairing and superconductivity.

Course Outcome: After completion of the full course the student should be able to	Cognitive level
C.O.1: Analyse the structure of materials based on X-ray diffraction and interpret it on the basis of the theory understood.	Analyse
C.O.2: Distinguish different excitations in crystals. Properties of quasiparticles could be explained. Arrive at proper explanation of for specific heat.	Analyse
C.O.3: Explain free electron model and interpret the properties of metals. Gain a deeper understanding of the energy bands based on the properties of carriers.	Understand
C.O.4: Interpret properly the thermal, electrical and magnetic properties of materials. Will enable the student to understand the current research going on in the related areas.	Analyse
C.O.5: Illustrate using phase diagrams, phase transitions in materials leading to superconductivity and different types of superconductors.	Analyse

1. Crystal Structure and binding

Symmetry elements of a crystal, Types of space lattices, Miller indices, Diamond Structure, NaCl Structure, BCC, FCC, HCP structures with examples, Description of X-ray diffraction using reciprocal lattice, Brillouin zones, Vander Waals interaction, Cohesive energy of inert gas crystals, Madelung interaction, Cohesive energy of ionic crystals, Covalent bonding, Metallic bonding, Hydrogen-bonded crystals (12 hours)

2. Lattice Vibrations

Vibrations of monatomic and diatomic lattices, Quantization of lattice vibrations, Inelastic scattering of neutrons, Einstein and Debye models of specific heat, Thermal conductivity, Effect of imperfection (9hours)

3. Electron States and Semiconductors

Free electron gas in three dimensions, Specific heat of metals, Sommerfeld theory of electrical conductivity, Wiedemann-Franz law, Hall effect, Nearly free electron model and formation of energy bands, Bloch functions, Kronig Penny model, Formation of energy gap at Brillouin zone boundaries, Number of orbitals in a band, Equation of motion of electrons in energy bands, Properties of holes, Effective mass of carriers, Intrinsic carrier concentration, Hydrogenic model of donor and acceptor states. Direct band gap and indirect band gap semiconductors (17 hours)

4. Dielectric, Ferroelectric and magnetic properties

Theory of Dielectrics: polarization, Dielectric constant, Local Electric field, Dielectric polarisability, Polarisation from Dipole orientation, Ferroelectric crystals, Order-disorder type of ferroelectrics, Properties of Ba Ti O₃, Polarisation catastrophe, Displasive type ferroelectrics, Landau theory of ferroelectric phase transitions, Ferroelectric domain, Antiferroelectricity, Piezoelectricity, Applications of Piezoelectric Crystals, Diamagnetism and Paramagnetism: Langevin's theory of diamagnetism, Langevin's theory of paramagnetism, theory of Atomic magnetic moment, Hund's rule, Quantum theory of magnetic Susceptibility Ferro, Anti and Ferri magnetism: Weiss theory of ferromagnetism, Ferromagnetic domains, Neel Model of Antiferromagnetism and Ferrimagnetism, Spin waves, Magnons in Ferromagnets (qualitative) (22 hours)

5. Superconductivity

Meissner effect, Type I and Type II superconductors, energy gap Isotope effect, London equation and penetration of magnetic field, Cooper pairs and the B C S ground state (qualitative, Flux quantization, Single particle tunneling, DC and AC Josephson effects, High T_c Superconductors(qualitative) description of cuprates, Enough exercises. (12 hours)

Text books:

1. C.Kittel,: Introduction to Solid State Physics 5th edition (Wiley Eastern)
2. A.J.Dekker: Solid State Physics (Macmillian1958)

Reference Books:

1. M.Ali Omar, Elementary Solid State Physics, Addison-Wesley Publishing Company
2. N.W. Ashcroft and Mermin : Solid State Physics (Brooks Cole(1976)
3. Elements of Solid State Physics, Srivastava J.P. Prentice Hall of India (2ndedn)
4. Ziman J.H. Principles of Theory of Solids - (Cambridge1964)

ELECTIVE I

(Elective-I to be opted from PHY3E01- PHY3E07)

PHY3E01: PLASMA PHYSICS (4C, 72 hrs)

Objective

- To understand the basic requirements for a medium to be called plasma.
- To understand the principle behind the production of plasma waves.
- To understand different instabilities likely to arise in a plasma medium.
- To apply the kinetic theory principles to derive the fluid equations in plasma.
- To understand the principles behind plasma confinement and subsequent achievement of nuclear fusion.

Course Outcome: After completion of the full course the student should be able to	Cognitive level
C.O.1: explore the motion of plasma particles in electric and magnetic fields. Enable to identify adiabatic invariants.	Analyse
C.O.2: Apply the principles of electrodynamics to understand the production and propagation of waves in plasma	Apply.
C.O.3: Understands the factors affecting instability of plasma.	Understand
C.O.4: Analyse Landau damping and its effects in plasma.	Analyse
C.O.5: Understand free electron laser action in plasma. Analyses the hurdles in plasma confinement.	Analyse.

1. Introduction to Plasma Physics

Existence of plasma, Definition of Plasma, Debye shielding 1D and 3D, Criteria for plasma, Applications of Plasma Physics (in brief), Single Particle motions -Uniform E & B fields, Nonuniform B field, Non uniform E field, Time varying E field, Adiabatic invariants and applications (15 hours)

Textbook : Chen, Sections 1.1 to 1.7.7, 2.1 to 2.8.3

2. Plasma as Fluids and waves in plasmas

Introduction –The set of fluid equations, Maxwell's equations, Fluid drifts perpendicular to B, Fluid drifts parallel to B, The plasma approximations, Waves in Plasma - Waves, Group velocity, Phase velocity, Plasma oscillations, Electron Plasma Waves, Sound waves, Ion waves, Validity of Plasma approximations, Comparison of ion and electron waves, Electrostatic electron oscillations parallel to B, Electrostatic ion waves

perpendicular to B, The lower hybrid frequency, Electromagnetic waves with B_0 , Cutoffs and Resonances, Electromagnetic waves parallel to B_0 , Experimental consequences, Hydromagnetic waves, Magnetosonic waves, The CMA diagrams (20 hours)

Textbook : Chen, Sections 3.1 to 3.6, 4.1 to 4.21

3. Equilibrium and stability

Hydro magnetic equilibrium, The concept of β , Diffusion of magnetic field into plasma, Classification of instability, Two stream instability, the gravitational instability, Resistive drift waves, the Weibel instability (13 hours)

Textbook : Chen, Sections 6.1 to 6.8

4. Kinetic Theory

The meaning of $f(v)$, Equations of kinetic theory, Derivation of the fluid equations, Plasma oscillations and Landau damping, the meaning of Landau damping, Physical derivation of Landau damping, Ion Landau damping, Kinetic effects in a magnetic field (12 hours)

Textbook : Chen, Sections 7.1 to 7.6.2

5. Interaction of plasmas with electron beam & introduction to controlled fusion

Two-stream instability, relativistic electron beam-plasma interaction, growth rate, Cerenkov free electron laser, free electron laser and energy gain, The problem of controlled fusion, Magnetic confinements such as Toruses, Mirrors, Pinches, Laser Fusion, Plasma heating (12 hours)

Textbook : 1. Interaction of electromagnetic waves with electron beams and plasmas by C.S. Liu and V.K. Tripathi.
2. Chen, Sections 9.1 to 9.8

Textbooks :

1. F. F. Chen, Introduction to Plasma Physics and Controlled Fusion, Volume I and II, Plenum Press, recent edition.
2. Interaction of electromagnetic waves with electron beams and plasmas by C.S. Liu and V.K. Tripathi, (1994) World Scientific

References:

1. K.L. Goswami, Introduction to Plasma Physics – Central Book House, Calcutta
2. J.A., Bitten Court, Fundamentals of Plasma Physics -Springer

PHY3E02: ADVANCED QUANTUM MECHANICS (4C, 72 hrs)

Objectives:

- To answer the fundamental questions regarding uncertainty principle and complementarity principle in physics.
- To understand the two schools of thought in quantum mechanics lead by Niels Bohr and Albert Einstein.
- To understand the conflict between locality and nonlocality in the context of quantum mechanics.
- To understand decoherence and related phenomena.
- To address the measurement problem in quantum mechanics.

Course Outcome: After completion of the full course the student should be able to	Cognitive level
C.O.1: Explain the subtle nature of quantum behaviour of particles and fields. Properties of waves and wave functions of particles are demonstrated through Bohm-Aharanov effect.	Understand
C.O.2: Show that experiments supported Copenhagen interpretation.	Apply
C.O.3: See that experiments were in support of nonlocality concepts.	Understand
C.O.4: Observe that Schrodinger cat gedanken experiment also could not support Einstein's arguments.	Analyse
C.O.5: Accept that observation influences or affects quantum mechanical systems. Entanglement and collapse of wavefunctions could also be understood from here.	Understand

1. Basic Concepts n the uncertainty principle, Complementarity principle, Information, Theory of quantum beats, The Aharonov – Bohm effect.

Textbook: Sections 3.3, 3.4 and 4.1 to 4.5 of George Greenstein & Arthur G. Zajonc

2. The EPR Experiment and Bell's Theorem: (15Hours)

The EPR argument, The BKS theorem, The hidden variable theories, The Bell's theorem and its proof, Tests of Bell's inequalities, Alain Aspect's experiments.

Textbook : Sections 5.1 to 5.3 and 6.1 of George Greenstein & Arthur G. Zajonc & 12.2 of David J Griffiths.

3. Nonlocality: (12Hours)

Bohm's nonlocal hidden variable theory, The Mystery of the EPR correlations, Nonlocality and principle of relativity, Quantum Nonlocality.

Textbook : Sections 6.2 to 6.5 & 6.7 of George Greenstein & Arthur G. Zajonc

4. Decoherence (17Hours)

Schrödinger's cat, Super positions and mixtures, Non-observation of quantum behaviour in macro systems, Decoherence, Watching decoherence

Textbook : Sections 7.1 to 7.6 of George Greenstein & Arthur G. Zajonc

5. The measurement problem in quantum mechanics: (18hours)

The measurement problem, The collapse of wave function, The infinite regress, The active nature of measurement in quantum mechanics, Decoherence and measurement problem, Elementary ideas of quantum cryptography and quantum teleportation.

Textbook : Sections : Chapter 8 complete & 9.1 to 9.3 of George Greenstein & Arthur G. Zajonc

Textbook : The Quantum Challenge: Modern Researches on the foundations of Quantum Mechanics - George Greenstein & Arthur G. Zajonc, Narosa Publishing house

Reference books:

1. Introduction to Quantum Mechanics: David J Griffiths, Pearson Education
2. Understanding Quantum Mechanics: Roland Omnès, Prentice-Hall, India
3. Quantum Theory and Measurement: J. A. Wheeler and W. H. Zurek, Princeton University Press, Princeton
4. Quantum Mechanics: V. K. Thankappan, Wiley Eastern, 2nd Ed.

PHY3E03: RADIATION PHYSICS (4C, 72 hrs)

Objectives:

- To classify radiations as ionising and nonionising and find the sources of each category.
- To identify the unique interaction mechanisms of each category of radiation,
- To quantify the radiation and understand the various units used in dosimetry, radiotherapy and environmental radioactivity studies.
- To understand the effect of radiation exposure to biological cells at a microscopic level.
- To identify the appropriate shielding materials and mechanisms to protect man and materials from damage due to excess exposure.

Course Outcome: After completion of the full course the student should be able to	Cognitive level
C.O.1: Verify through experiments that radiations are primarily divided into ionising and nonionising. Also understand different sources under each category. Production methods of each will also be identified.	Analyse
C.O.2: Analyse the interaction mechanism of each category, giving emphasize to scattering and absorption.	Analyse
C.O.3: Exposure leads to beneficial or harmful effects. Understands details of both.	Understand
C.O.4: Analyse both stochastic and deterministic effects depending upon radiation dose received.	Analyse
C.O.5: Implement proper shielding in laboratory where sources are stored and in transportation.	Analyse`
C.O.6: After M.Sc Physics, if PG Diploma courses of BARC or other recognised institutions are carried out, there are plenty of opportunities for radiation physicists in an outside the country.	Apply

1. Radiation source:

Types of radiations, ionizing, non ionizing, electromagnetic, particles, neutral -gamma-neutrino-neutron, charged alpha, beta, gamma, and heavy ion sources, radioactive sources – naturally occurring production of artificial isotopes, accelerators–cyclotrons, nuclear reactors.(12 hours) {Ref 1,2}

2. Interaction of radiations with matter:

Electrons – classical theory of inelastic collisions with atomic electrons, energy loss per ion pair by primary and secondary ionization, specific energy loss, bremsstrahlung, range energy relation, energy and range straggling Heavy charged particles – stopping power, energy loss, range and range – energy relations, Bragg curve, specific ionization, Gamma rays – Interaction mechanism – Photoelectric absorption, Compton scattering, Pair production, gamma ray attenuation, attenuation coefficients, Elastic and inelastic scattering, Cross sections, linear and mass absorption coefficients, stopping power, LET,Neutrons – General properties, fast neutron interactions, slowing down and moderation.(17 hours) Ref 1,2}

3. Radiation quantities, Units and Dosimeters:

Particle flux and fluence, calculation of energy flux and fluence, curie, Becquerel, exposure and its measurements, absorbed dose and its relation to exposure, KERMA, Biological effectiveness, weighting factors, (WR and WT), Equivalent dose, Effective dose, Dosimeters, Primary and secondary dosimeters, Pocket dosimeter, Films and solid dosimeter (TLD and RPL), Clinical and calorimetric devices , Radiation survey meter for area monitoring. (15 hours) {Ref 2,3}

4. Biological effects:

Basic concepts of cell biology, Effects of ionizing radiations at molecular, sub molecular and cellular levels, secondary effects, free radicals, deterministic effects, stochastic effects,, Effects on tissues and organs, genetic effects, Mutation and chromosomal aberrations, applications in cancer therapy, food preservation, radiation and sterilization (12 hours) {Ref 3,4}

5. Radiation protection, shielding and transport:

Effective radiation protection, need to safeguard against continuing radiation exposure, justification and responsibility, ALARA, concept of radiologic practice. time distance and shielding, safety specifications. method of radiation control, Shielding factor for radiations, Choice of material, Primary and secondary radiations, Source geometry, Beta shielding, Gamma shielding, neutron shielding, Shielding requirements for medical, industrial and research facilities, handling of the source, sealing, transport and storage of sealed and unsealed sources. records, spills. waste disposal, Enough exercises. (16 hours) {Ref 3,4,5}

PHY3E04: DIGITAL SIGNAL PROCESSING (4C, 72 hrs)

Objectives:

- Understand basics of A/D and D/A conversion.
- Identify the different types of signals and systems with emphasis on LTI Systems
- Apply the principles of discrete-time signal analysis to perform various signal operations
- Understand basic ideas of Z transform and apply the principles of z-transforms to finite difference equations and LTI systems
- Apply the principles of Fourier transform analysis to describe the frequency characteristics of discrete-time signals and systems
- Understand basics of Discrete Fourier transform and application of DFT in filtering
- Apply the idea of FFT in computational algorithm

Course Outcome: After completion of the full course the student should be able to	Cognitive level
C.O.1: Use concepts of complex analysis, Fourier transform, z-transform to analyze the operations on signals and acquire knowledge about System	Apply
C.O.2: Have proper understanding of frequency domain analysis of discrete time signals	Understand
C.O.3: Ability to identify, formulate, analyze and solve problems involving digital signals	Evaluate
C.O.4: Ability to use the techniques, skills and modern technical tools necessary for technical or engineering practice	Apply
C.O.5: Design, implementation, analysis and comparison of digital filters for processing of discrete time signals	Analyse

1. Introduction:

Signals and systems, Classification of signals, Concept of frequency in continuous time and discrete-time signals. Theory of A/D and D/A conversion, Sampling of analog signals, sampling theorem. Quantization of continuous amplitude signals. Quantization of sinusoidal signal, Coding of quantized samples- Digital to analog conversion **(9 hours)**

Textbook : Digital Signal Processing by Proakis & Manolakis, Prentice Hall of India (Fourth edition - 2013)– chapter 1 (complete)

2. Discrete- time signals and systems:

Discrete- time linear time-invariant systems-Techniques of analysis of linear systems, Resolution of a discrete time signal into impulses- Response of LTI systems to arbitrary inputs : Convolution sum-Properties of convolution and the interconnection of LTI systems- Casual LTI systems Stability of LTI systems- Systems with finite duration and infinite duration impulse, response. Discrete- time systems described by difference equations-

Recursive and non-recursive discrete, time systems LTI systems characterized by constant coefficient difference equations, Solution to linear constant coefficient difference equations, correlation of discrete-time signals. **(12 hours)**

Textbook : Digital Signal Processing by Proakis & Manolakis, Prentice Hall of India (Fourth edition - 2013)Chapter 2 (complete)

3. The Z-transform:

The Direct Z-Transform, The Inverse Z-Transform. Properties of Z-transform, Rational Z-transforms, Poles and zeros, Inversion of Z-transforms. The inverse Z-Transform by contour integration, Power series expansion, Partial fraction expansion – Decomposition of rational Z-transform–Analysis of linear time-invariant systems in the Z-domain **(15 hours)**

Textbook : Digital Signal Processing by Proakis & Manolakis, Prentice Hall of India (Fourth edition -2013) (Section-3.6- 3.6.2)

4. Frequency Analysis of Signals and Systems:

Frequency analysis of continuous-time signals.- The Fourier Series for continuous Time Periodic signals, Power Density Spectrum of Periodic Signals, The Fourier Transform of Continuous -Time Aperiodic Signals, Energy Density Spectrum of Aperiodic Signals, Frequency analysis of discrete time signals-The Fourier Series for discrete time Periodic Signals, Power Density Spectrum of Periodic Signals, Fourier transform for discrete time aperiodic signal, Convergence of the Fourier Transform, Energy Density Spectrum of aperiodic signals, Relationship of the Fourier Transform to the Z Transform, The Cepstrum. Properties of the Fourier Transform for Discrete Time Signals . LTI systems as Frequency selective filters: Ideal filter characteristics, Lowpass, Highpass and Band pass filters, Digital resonators, Notch filters, Comb filters, All-pass filters– Characteristics of practical frequency-selective filters, Design of linear- phase FIR filters using windows . **(24 hours)**

Textbook: Digital Signal Processing by Proakis & Manolakis, Prentice Hall of India (Fourth edition -2013) Chapter 4-sections 4.1,4.2 and 4.4, chapter 5 section 5.4, chapter 10 sections 10.1.2, 10.2.2)

5. Discrete Fourier Transform:

Frequency domain sampling and reconstruction of discrete time signals – The Discrete Fourier transform – DFT as a linear transformation - Relationship of the DFT to the other transforms. Properties of DFT, Multiplication of two DFTs and Circular convolution, Linear filtering methods based on DFT - Frequency analysis of signals using the DFT – Discrete cosine transform - Computation of the Discrete Fourier Transform - Fast Fourier Transform algorithm (basic ideas only) , Enough exercises.**(12hours)**

Textbook: Digital Signal Processing by Proakis & Manolakis, Prentice Hall of India (Fourth edition -2013) chapter 7 (complete), sections 8.1.1, 8.1.2

Textbook:

Digital Signal Processing by Proakis & Manolakis, Prentice Hall of India (Fourth edition -2013)

Reference Books:

1. Digital Signal Processing by Oppenheim & Schafer, Prentice Hall India–1995
2. Digital Signal Processing by Paulo S.R. Piniz, Eduardo A.B. De Silva and Sergio Netto – Cambridge University Press
3. Analog and digital signal processing by Ashok Ambradar
4. Theory and Applications of Digital Signal Processing , Rabiner& Gold, Prentice Hall India - 1996.

PHY3E05: EXPERIMENTAL TECHNIQUES (4C, 72 hrs)

Objectives :

- To impart knowledge on vacuum techniques, pumps and measuring gauges.
- To learn the different thin film fabrication techniques, thickness measurement and application.
- Knowledge on different types of particle accelerators and their uses
- Learn the methods of different materials analysis by nuclear techniques
- Understand different X-Ray techniques to characterize materials.

Course Outcome: After completion of the full course the student should be able to	Cognitive level
C.O.1: Explain vacuum, Gauges to measure vacuum, types of pumps and their utility, cryogenics etc.	Understand
C.O.2: Explain and demonstrate different thin film fabrication techniques, thickness measurement and application of thin films	Apply
C.O.3: Explain different types of particle accelerators, their working and specific applications	Understand
C.O.4: Explain methods of materials analysis by different nuclear techniques.	Understand
C.O.5: Be trained on defining X-ray techniques to characterise materials.	Apply

1. Vacuum Techniques

Units and basic definitions, Roughing pumps - Oil sealed rotary vacuum pump and Sorption pump, High vacuum pumps – Turbo molecular pump, Diffusion pump, Oil vapour booster pump, Ion pumps - Sputter ion pump and Getter ion pump, Cryo pump, Vacuum gauges - Pirani gauge, Thermocouple gauge, penning gauge (Cold cathode Ionization gauge) and Hot filament ionization gauge, Vacuum accessories – Diaphragm, Gate valve, Butterfly valve, Baffle and isolation valves, magnetic valves, adjustable valves, air inlet valves, Traps - Liquid nitrogen trap, Sorption traps, and gaskets and O rings (19hours)

Textbook : Muraleedhara Varier et al. “Advanced Experimental Techniques in Modern Physics”, Sections 1.4, 1.6 – 1.8, 1.9.2.3 – 1.9.2.5, 1.10.1, 1.10.6, 1.10.3

2. Thin film techniques

Introduction, Fabrication of thin films, Thermal evaporation in vacuum – Resistive heating, Electron beam evaporation and laser evaporation techniques, Sputter deposition, Glow discharge, Thickness measurement by quartz crystal monitor, optical interference method, electrical conductivity measurement, Thermoelectric power, Interference filters - Multi layer optical filters, Technological Applications of thin films. (14hours)

Textbook : Muraleedhara Varier, et al. “Advanced Experimental Techniques in Modern Physics” Sections 2.1, 2.2.1.1, 2.2.1.4, 2.2.1.5, 2.2.2, 2.3.2, 2.3.3, 2.3.1, 2.7, 2.6.1

3 Accelerator techniques

High voltage DC accelerators, Cascade generator, Van de Graaff accelerator, Tandem Van de Graaff accelerator, Linear accelerator, Cyclotron, Synchrotron (Electron and proton), Ion sources – Ionization processes, simple ion source, ion plasma source and RF ion source, Ion implantation – techniques and profiles, Ion beam sputtering– principles and applications. (14 hours)

Textbook : Muraleedhara Varier, et al. “Advanced Experimental Techniques in Modern Physics”, Sections 4.3, 4.4, 4.5.1, 4.5.4, 4.5.5, 4.6, 4.8.1 – 4.8.3, 4.9

4. Materials Analysis by nuclear techniques

Introduction, Basic principles and requirements, General experimental setup, mathematical basis and nuclear reaction kinematics, Rutherford backscattering – introduction, Theoretical background – classical and quantum mechanical, experimental set up, energy loss and straggling and applications. Neutron activation analysis – principles and experimental arrangement, applications, Proton induced X-ray Emission – principle and experimental set up, applications to water samples, human hair samples and forensic samples, limitations of PIXE.(15 hours)

Textbook: Advanced Experimental Techniques in Modern Physics – K. Muraleedhara Varier, Antony Joseph and P.P.Pradyumnan, Pragati Prakashan, Meerut (2006)

5. X- Ray Diffraction Technique

Introduction, Lattice planes and Bragg's Law, Diffractometer - Instrumentation, Single crystal and Powder diffraction, Scherrer equation, Structure factor, Applications of XRD - Crystallinity, Unit Cell Parameters, Phase transition studies, thin film studies, Awareness on Powder Diffraction File (PDF) of the International Centre for Diffraction Data. (10hours)

Textbook: Elements of Modern X-ray Physics, Jens Als Nielsen and Des McMorrow, (John Wiley and Sons 2000)

Reference books:

1. Scientific foundations of vacuum techniques – S. Dushman and J.M. Laffer, John Wiley New York(1962)
2. Thin film phenomena – K.L. Chopra, Mc Graw Hill(1983)
3. R. Sreenivasan – Approach to absolute zero - Resonance magazine Vol 1 no 12, (1996) , vol 2 nos 2, 6 and 10(1997)

5. Dennis and Heppel – Vacuum system design
6. Nuclear Micro analysis – V.Valkovic
7. B.D. Cullity, Elements of X-ray diffraction, Addison Wesley Inc(1978)
8. Useful link for XRD-<http://pd.chem.ucl.ac.uk/pdnn/powintro/whatdiff.htm>

PHY3E06 : ELEMENTARY ASTROPHYSICS (4C, 72 hrs)

Objectives

- Identify celestial objects from their celestial co-ordinates
- Understand photometric and spectroscopic measuring techniques
- Understand stellar evolution
- Understand how to make astronomical observations from ground in optical and radio wavelengths. Also understand the tools and techniques used to study celestial objects in multi-wavelengths.
- Learn space observation techniques carried out using satellites.

Course Outcome: After completion of the full course the student should be able to	Cognitive level
C.O.1: Plan the observation, given co-ordinates of a celestial source.	Apply
C.O.2: Use the results of photometric and spectroscopic observation to study the properties of stars.	Analyse
C.O.3: Apply the principles of physics to understand stellar evolution	Apply
C.O.4: Understand various techniques involved in ground based observations.	Understand
C.O.5: Describe the techniques involved in the observation of celestial objects using space satellites.	Analyse

1. The Celestial Co-ordinate systems

Identification of stars- spherical coordinates - the Alt - azimuth system – Local equatorial system – the universal equatorial system – aspects of sky at a given place - Other systems - Stellar parallax and units of stellar distance. (14hours)

2. Stellar magnitude sequence

Absolute magnitude and distance modulus, Colour index of a star, Luminosity of stars. Spectral classification of stars, Boltzmann's formula, Saha's equation of thermal ionization, Harvard system of classification, Luminosity effect of stellar spectra, Importance of ionization theory, Spectroscopic parallax. (15hours)

3. Hertzsprung - Russel diagram

Structure and evolution of stars, Observational basis, Equation of state for stellar interior, Mechanical and thermal equilibrium in stars, Energy transport in stellar interior, Energy generation in stars (thermonuclear reactions), Stellar evolution, White dwarfs, Neutron stars, pulsars and black holes. (15hours)

4. Astronomical Instruments

Optical properties of telescopes - aberrations – Special purpose telescopes– photometry, photographic & photo-electric - instruments and techniques – radio telescopes. (14hours)

5. Space Astronomy

Infrared Astronomy, detection and measurement–Ultra- violet astronomy, range and importance – X-ray astronomy – Gamma ray astronomy. (14hours)

Textbooks:

1. K. D. Abhyankar: “Astrophysics – stars and galaxies”, (Universities press) Relevant sections from Chapters 2, 19 and 20.
2. Baidyanath Basu M :“An introduction to Astrophysics” (Prentice Hall of India), Relevant sections of Chapters 3, 4, 14 and 15.

Reference books:

1. Gerald North: “Astronomy explained”, (Springer, 2011)

PHY3E07: INTRODUCTION TO NANOSCIENCE AND TECHNOLOGY (4C, 72 hrs)

Objectives

- Develop a firm understanding of the basics of nanoscience, its ramifications, and application areas.
- Illustrate properties of nanoparticles when compared to bulk.
- Understand what are bulk nanostructured materials.
- Explore the rare quantum mechanical features 0- dimensional and higher dimensional nanoobjects.
- Predict the quantum effects on different properties of nanomaterials.

Course Outcome: After completion of the full course the student should be able to	Cognitive level
C.O.1: Comprehend the basic principles of nanoscience and nanotechnology	Understanding
C.O.2: Have an idea of the structure of nanoparticles	Analyse
C.O.3: Explore the size dependence of various properties	Analysis
C.O.4: Evaluate different quantum systems in zero, one, two and three dimension at the nanoscale	Evaluate
C.O.5: Predict the quantum effect on the properties of nanomaterials	Apply

1. Introduction to Nanoscience and Technology

Definitions of Nanoscience and nanotechnology, Uniqueness of nanoscale, Nanoscience in nature, Nanoscience in action in biological world, Nanomaterials, nanoparticles, nanowires and nanotubes, nanolayers and nanocoatings, nanoporous materials, Properties of nanomaterials, Significance of Nanoscience, Applications, Nanomaterials - general synthetic approaches, top down, bottom up (16 hours)

Textbook : Sections (1.1, 1.2, 1.3, 1.5, 1.7, 1.8, 1.9, 2.1, 2.2, 2.3) of Essentials in Nanoscience and nanotechnology by Narendra Kumar and Sunita Kumbhat, John Wiley & Sons, 2016

2. Properties of Nanoparticles

Introduction, metal nanoclusters, magic numbers, Theoretical modelling, geometric structure, electronic structure, Reactivity, fluctuations, magnetic clusters, bulk to nanotransition, semiconducting nanoparticles. (12 hours)

Textbook: Sections: 4.1, 4.2.1 to 4.2.8, 4.3 of Introduction to nanotechnology by Charles P Poole Jr. and Frank J Owens

3. Properties of Bulk Nanostructured Materials

Solid disordered nanostructures, Methods of Synthesis, Failure Mechanisms of Conventional Grain-Sized Materials, Mechanical Properties, Nanostructured multilayers, Electrical Properties, Other Properties (16 hours)

Textbook: Sections: 6.1.1 to 6.1.6 of Introduction to nanotechnology by Charles P Poole Jr. and Frank J Owens, John Wiley and Sons, 2003

4. Quantum nanoengineering

Particle in a box, Quantum limit: from 3 - d to 0 - d - Quantum confinement in semiconductors-Potential step, Potential barrier- quantum well, 3-d density of states, 2-d model - energy eigenvalues, density of states, 1 - d model- energy eigenvalues, density of states Q 0-D model- energy eigenvalues (18 Hrs.)

Textbook: Sections: 4.1,4.2 of Chapter 4 Amretashis Sengupta, Chandankumar Sarkar, Introduction to Nano-Basics to nanoscience and nanotechnology , Springer Publications, 2015

5. Quantum effect on properties of nanomaterials

Introduction, melting point, electronic structure and optical property, magnetic property, mechanical property, dielectric property (10 hours)

Textbook : Sections: 5.1,5.2,5.3,5.4,5.5,5.6 of Chapter 5 Amretashis Sengupta, Chandankumar Sarkar, Introduction to Nano - Basics to nanoscience and nanotechnology, Springer Publications, 2015

Textbooks:

1. Essentials in Nanoscience and nanotechnology, Narendra Kumar and Sunita Kumbhat
2. Introduction to nanotechnology Charles P Poole Jr. and Frank J Owens, John Wiley & Sons, 2003
3. Amretashis Sengupta, Chandankumar Sarkar Introduction to Nano-Basics to nanoscience and nanotechnology Springer Publications 2015

Reference books:

1. Nanotechnology: Principles and Practices (3rdEdition), Sulabha Kulkarni, CPC-New Delhi and Springer, 2007
2. Quantum Mechanics for Nanostructures, Vladimir V. Mitin, Dmitry I. Sementsov, Nizami Z. Vagidov Cambridge University Press, 2006
4. Introduction to Nanoscience—SM Lindsay-Oxford University, 2010
5. Introduction to Nanoscience and Nanotechnology-Gabor L. Hornyak ,H.F. Tibbals, Joydeep Dutta, John J. Moore, CRC Press, 2009

SEMESTER IV

PHY4C12: ATOMIC AND MOLECULAR SPECTROSCOPY (4C, 72 hrs)

Objectives:

- To provide an understanding of the interaction of electromagnetic waves with matter.
- To understand different spectroscopic techniques and the corresponding instrumentations.
- To realize the role and practical application of spectroscopy in research and development.

Course Outcome: After completion of the full course the student should be able to	Cognitive level
C.O.1: Understand the behavior of atoms and molecules and their interactions with electromagnetic waves.	Understanding
C.O.2: Apply the behaviour of nonrigid rotor and understand the microwave spectroscopy	Apply
C.O.3: Distinguish between Raman and IR spectroscopy and elucidate on the features of Raman spectrum.	Analyse
C.O.4: Explain electronic spectroscopy and applications	Analyse
C.O.5: Identify the structure of the sample from spin resonance and Mossbauer spectra	Evaluate

1. Atomic Spectroscopy

Vector Atom model – L S coupling & J J coupling, effect of electric & magnetic field on atoms and molecules; Zeeman effect, Paschen Back effect and Stark effect (12hours)

Textbook: Sections 10.1 to 10.11, 12.1 to 12.10, 13.1 to 13.9, 20.1 to 20.8 – Introduction to atomic spectra by H E White

2. Microwave and Infrared spectroscopy

The spectrum of nonrigid rotator, e.g. of HF, spectrum of symmetric top molecule e.g. of CH₃Cl, Instrumentation for Microwave Spectroscopy Stark Modulator, Information derived from Rotational Spectrum: I R Spectroscopy: Born – Oppenheimer approximation, Effect of Breakdown of Born Oppenheimer approximation, Normal modes and vibration of H₂O and CO₂. Instrumentation for I R Spectroscopy – Fourier transformation I R Spectroscopy (17hours)

Textbook: Sections 6.6, 6.7, 6.8, 6.9, 6.11, 6.13, 6.14, 7.1 to 7.7, 7.12, 7.15, 7.16, 7.17, 7.18 Molecular structure and Spectroscopy by G. Aruldhas

3. Raman Spectroscopy:

Rotational Raman Spectrum of Symmetric top molecules, e.g. of CHCl_3 Combined use of Raman & IR Spectroscopy in structure determination e.g. of CO_2 and NO_3 . Instrumentation for Raman Spectroscopy, Non-linear Raman effects, Hyper Raman effect, stimulated Raman effect and Inverse Raman Effect (14hours)

Textbook: Sections 8.32, 8.4, 8.5, 8.6, 8.7, 8.10, 15.1, 15.215.3, 15.4 Molecular structure and Spectroscopy by G.Aruldas

4. Electronic Spectroscopy of molecules

Vibrational Analysis of band systems, Deslander's table, Progressions & sequences, Information Derived from vibrational analysis, Franck Condon Principle. Rotational fine structure and P R and R Branches, fortrat Diagram, Dissociation Energy, Example of Iodine molecule (12hours)

Textbook: Sections 9.1 to 9.9 Molecular structure and Spectroscopy by G Aruldas

5. Spin Resonance Spectroscopy:

Interaction of nuclear spin and magnetic field, level population Larmour precession, Resonance Conditions, Bloch equations, Relaxation times, Spin-spin and spin lattice relaxation. The chemical shift, Instrumentation for NMR spectroscopy, Electron Spin Spectroscopy of the unpaired e, Total Hamiltonian, Fine structure, Electron Nucleus coupling, and hyperfine spectrum ESR spectrometer. Mossbauer Spectroscopy, Resonance fluorescence of gamma-rays, Recoilless emission of gamma-rays and Mossbauer effect, Chemical shift, effect of magnetic field. Eg. of Fe^{57} Experimental techniques. (17hours)

Textbook: Sections 10.1 to 10.9, 11.1 to 11.5.4, 13.1 to 13.5 Molecular structure and Spectroscopy by G. Aruldas

Textbooks:

1. Molecular Structure & Spectroscopy, G Aruldas, Prentice Hall India Learning Private Limited; 2nd edition (1 January 2007)
2. Fundamentals of Molecular Spectroscopy, C N Banwell & E.M. Mccash, McGraw Hill Education; 4th edition (30 August 1994)
3. Introduction to Atomic Spectra, White, McGraw-Hill Education / Asia (16 November 1963)

Reference books:

1. B.P. Straughan and S. Walker Spectroscopy Volume I, II and III, London : Chapman and Hall ; New York : Wiley ; distributed in the U.S.A. by Halsted Press, 1976
2. G.M.Barrow – Introduction to Molecular Spectroscopy, McGraw-Hill Inc.,US (1 December 1962)
3. H.H. Willard, Instrumental Methods of Analysis, 7th Edition , CBS-Publishers, New Delhi.
4. Atomic Spectroscopy –K P Rajappan Nair, MJP Publishers, Chennai
5. Elements of spectroscopy Gupta &Kumar –Pragati Prakasan, Meerut

Elective -II

(Elective-II to be opted from PHY4E08- PHY4E17)

PHY4E08: ADVANCED NUCLEAR PHYSICS (4C, 72 hrs)

Objectives:

- To understand the basic shell structure of nuclei. More and more improved potentials and consideration of nuclear deformations give rise to better agreement between theory and experiment in nuclear physics. Magic nuclei are of special interest in these studies.
- To apply the principles of rigid body dynamics in nuclear systems to explain collective motion.
- To understand the theories of nuclear reaction at a deeper level.
- The theory of nuclear fission is introduced here as a pre-requirement for moving to a module on reactor physics.
- To understand the application of nuclear principles in the operation of reactors.

Course Outcome: After completion of the full course the student should be able to	Cognitive level
C.O.1: explain various observed phenomena in nuclei with better accuracy.	Analyse
C.O.2: apply the principles of rigid body dynamics and taking into account different core+nucleon coupling schemes, diverse phenomena at high angular momentum can be explained.	Apply
C.O.3: apply the principles of partial wave to analyse the results. Become conversant in the use compound nuclear formation theories.	Apply
C.O.4: understand nuclear binding energy and proceed through the statistical model calculations to estimate fission cross sections.	
C.O.5: understand reactor physics, which is a special topic, more related to industry. Fick's law of diffusion for neutron flow and other considerations enables to estimate the critical mass and criticality condition in breeder reactors.	

1. Nuclear Shell Model

Shell structure and magic numbers, The nuclear one particle potential, spin-orbit term, realistic one body potentials, Nuclear volume parameter, single particle spectra of closed shell + 1 nuclei, Harmonic oscillator and infinite square well potentials in 3- dimensions, coupling of spin and orbital angular momentum, magnetic dipole moment and electric quadrupole moment, Schmidt diagram; Single particle orbitals in deformed nuclei,

perturbation treatment, asymptotic wave functions, single particle orbitals in an axially symmetric modified oscillator potential (18 Hours)

Textbook : “Shapes and Shells in Nuclear Structure”, S.G. Nilsson and I. Ragnarsson, Sections Chapter 5, 6, 7, 8.1-8.6

2. Nuclear collective models

Nuclear rotational motion- rotational energy spectrum and wave functions for even-even and odd A nuclei - Nuclear moments- collective vibrational excitations, Rotational Bands - The particle rotor model, strong coupling- deformation alignment, Decoupled bands - rotational alignment; two particle excitations and back-bending; Fast nuclear rotation- the cranking model; Rotating harmonic oscillator (12 Hours)

Textbooks :

1. “Nuclear Physics- Theory and Experiment”, R.R. Roy and B.P. Nigam (Wiley Eastern) Sections, 8.1 –8.5
2. “Shapes and Shells in Nuclear Structure”, S. G. Nilsson and I. Ragnarsson, Sections : 11, 11.1 – 11.3, 12, 12.1,12.2

3. Nuclear Reactions

Reactions and Cross-sections, Resonances, Breit-Wigner formula for $l = 0$, Compound Nucleus formation, continuum theory, statistical theory, evaporation probability, Heavy ion reactions (12 Hours)

Textbooks :

1. “Nuclear Physics- Theory and Experiment”, R.R. Roy and B.P. Nigam (Wiley Eastern) Sections 6.1, 6.2, 6.4 –6.8
2. Kenneth S. Krane – “ Introductory Nuclear Physics”, (Wiley), Section 11.13

4. Nuclear Fission

The semi-empirical mass formula , The stability peninsula, nuclear fission and the liquid drop model, some basic fission phenomena, fission barrier .Nuclear Fission- cross-section, spontaneous fission, Mass and energy distribution of fragments, Statistical model of Fission (15Hours)

Textbook : “Nuclear Physics- Theory and Experiment”, R.R. Roy and B.P. Nigam (Wiley Eastern) Sections, Chapter 5 full

5. Reactor Physics

Fick’s law and its validity, Diffusion equation, diffusion length, Energy loss in elastic collision,

Lethargy, Fermi age equation- solutions and measurement of age, Fermi age theory of bare thermal reactors, criticality , one region finite thermal reactor, criticality condition for different geometries (15 Hours)

Textbook : “Introduction to Nuclear Reactor Theory”, B.R. Lamarsh (Addison- Wesley) Sections 5.1, - 5.7, 5.11, 6.1, 6.4, 6.9– 6.14, 9.1 – 9.8

Reference Books :

1. “Introductory Nuclear Physics”, Samuel M. Wong (Prentice Hall India 1996) Chapter7)
2. “Nuclear Physics – Experimental and theoretical” – H.S. Hans, New Age International(2001)
3. “Theory of nuclear structure” – M.K Pal, (East West Press PvtLtd)

PHY4E09: ADVANCED ASTROPHYSICS (4C, 72 hrs)

Objectives:

- Understand various radiative process involved in Astrophysics
- Understand different types of variable stars.
- Acquire the basic understanding of morphological classification of galaxies.
- Understand general relativistic formulation for the study of Universe
- Compare different Cosmological models.

Course Outcome: After completion of the full course the student should be able to	Cognitive level
C.O.1: Connect the observation of radiation in a particular wavelength from a celestial source to its possible nature and state.	Apply
C.O.2: Understand the physics involved in the formation of variable stars.	Understand
C.O.3: Compare various models involved in the formation and evolution of galaxies.	Analyse
C.O.4: Explain how to develop cosmological models.	Apply

1. Radiative Process:

Theory of Black Body Radiation-Photoelectric Effect-Pressure of Radiation -Absorption and Emission spectra - Doppler Effect - Zeeman Effect- Bremsstrahlung - Synchrotron Radiation - Scattering of Radiation - Compton Effect - and Inverse Compton effect (10 Hours)

Textbook : Baidyanath Basu, Ch 2

2. Variable stars:

Classification of Variable stars – Cepheid variables – RV Tauri variables - Mira variables – Red Irregular and Semi-regular variables – Beta Canis Majoris Variables–U Geminorum and Flare stars– Theory of Variable stars. (10 hours)

Textbook : Baidyanath Basu, Ch. 8

3. Galaxies

The Milkyway galaxy - Kinematics of the Milkyway – Morphology – Galactic Centre – Morphological classification of galaxies – Effects of environment – Galaxy luminosity function – The local group – Surface photometry of galaxies - ellipticals and disk galaxies – Globular cluster systems – Abnormal galaxies-Active galactic nuclei. (24 Hours)

Textbook : Binney & Merrifield, Ch.4

4. General Relativity:

General Considerations - Connection Between Gravity and Geometry - Metric Tensor and Gravity - Particle Trajectories in Gravitational field - Physics in curved space-time – Curvature - Properties of

Energy and momentum Tensor - Schwarzschild Metric - Gravitational Collapse and Black Holes – Gravitational Waves (16 Hours)

Textbook : Padmanabhan, Vol 2, Ch.11

5. Cosmology

Cosmological Principle - Cosmic Standard Coordinates - Equivalent Coordinates – Robertson-Walker Metric - The Red Shift - Measures of Distance – Red Shift Versus Distance Relation - Steady State Cosmology (12 Hours)

Textbook : Narlikar, Sections 3.1-3.8

Textbooks:

1. An Introduction to Astro Physics - Baidyanath Basu- Prentice Hall India (1997)
ISBN:81-203-1121-3
2. Galactic Astronomy – J. Binney & M. Merrifield, Princeton University Press
3. Theoretical Astrophysics Vol 1 and 2- T. Padmanabhan- Cambridge University Press (2000) ISBN: 0-521-56240-6,0-521-56241-4
4. An Introduction to Cosmology, Third Edition - J. V. Narlikar, Cambridge University Press (2002)

Reference Books :

1. Gravitation & Cosmology-Steven Weinberg- John Wiley (1972) ISBN:0-471-92567-5
2. Quasars and Active Galactic Nuclei- Ajit K Kembhavi and Jayat V Narlikar- Cambridge University Press (1999)ISBN:0-521-47477-9
3. The Physical Universe, An Introduction to Astronomy-F. Shu-Oxford University Press- (1982) ISBN:0-19-855706-X
4. A Different Approach to Cosmology - Fred Hoyle, Geoffrey, Jayant V Narlikar Cambridge University Press (2000)ISBN:0-521-66223-0
5. Discovering the Cosmos - R.C. Bless - University Science Books (1996) - ISBN:0- 935702-67-9
6. Text Book of Astronomy and Astrophysics with Elements of Cosmology - V.B. Bhatia - Narosa publications (2001)ISBN:81-7319-339-8
7. Modern Astrophysics - B.W. Carroll & D.A. Ostile - Addison Wesley (1996) ISBN:0-201- 54730-9
8. Galactic Dynamics – J. Binney & S. Tremaine, Princeton University Press

PHY4E10: ASTROPHYSICS AND ASTRONOMICAL DATA ANALYSIS
(4C, 72 hrs)

Objectives :

- Elucidate on the importance of astrophysics, the oldest science.
- Compare the ancient and modern astronomical tools and techniques
- Describe stellar evolution stages and sequences.
- Identify the features of galaxies from observational data
- Compare the features of X-ray and infrared astronomy.

Course Outcome: After completion of the full course the student should be able to	Cognitive level
C.O.1: Evaluate the basic parameters of a stellar object from the measured .	Evaluate
C.O.2: Describe the stellar evolution stages and sequences of a single star and a binary star	Analyse
C.O.3: Illustrate how surface photometry of galaxies change with their morphology	Apply
C.O.4: Interpret an X-ray image	analysis

1. **Introduction to Astronomy and astrophysics**

Astronomy and astrophysics – importance, methods and scope, Apparent luminosities of stars. Mass, length and time scales in astrophysics, the emergence of modern astrophysics, celestial coordinates, magnitude scale, applications of physics to , sources of astronomical information (12 Hours)

Textbooks

1. Astrophysics – stars and galaxies by K D Abhyankar : Chapter 1 and 3)
2. Astrophysics for physicist by Arnab Rai Choudhari Chapter 1: 1.1- 1.6)

2. **Stellar Physics**

Stellar observational data and determination of stellar parameters, main sequence, red giants and white dwarfs, Stellar evolution, stellar rotation and magnetic fields, supernovae, Binary X-ray sources-Accretion disks (8Hours)

Textbook : Astrophysics for physicist by Arnab Rai Choudhari - Chapter 3: 3.5,3.6, Chapter 4 : 4.5,4.7,4.8 , Chapter 5 : 5.6

3. **Galaxies**

The Milkyway galaxy - of the Milkyway –Morphology –Galactic Centre –Morphological classification of galaxies –Effects of environment –Galaxy luminosity function –The local group

–Surface photometry of galaxies - ellipticals and disk galaxies –Globular cluster systems – Abnormal galaxies-Active galactic nuclei. (24Hours)

Textbook : Binney & Merrifield, Chapter 4.

4. **X-ray astronomy**

X-ray data reduction – event file, data, extracting analysis product and calibration and analysis, X-ray data analysis – introduction, low resolution spectral analysis, imaging analysis, timing analysis. (12 Hours)

Textbook : Handbook of X-ray astronomy – Edited by Keith A Arnaud, Randal K Smith and Aneta Siemiginowska - Chapter 4 : 4.1-4.4, Chapter 5 : 5.1, 5.2.1 - 5.2.4, 5.4,5.5

5. **Infrared astronomy**

Infrared sky - Introduction, Atmospheric transmission, Terrestrial background radiation, Extraterrestrial background sources, South Pole sites, The sky as revealed by infrared surveys, Balloon and airplane observatories, Satellite observatories, Infrared databases, Infrared photometry - Infrared photometric bands, Standard star observations, Colors of normal stars, Absolute calibration, IRAS photometry, Bolometric magnitudes, Stellar effective temperatures Photometry. (16 Hours)

Textbook : Handbook of infrared astronomy by I S Glass – Chapter 2,3

Reference books :

- 1) Astrophysics – stars and galaxies by K D Abhyankar, University Press. (First edition)
- 2) Astrophysics for physicist by Arnab Rai Choudhari, Cambridge University Press.(First South Asian edition) Galactic Astronomy by James Binney & Merrifield, Princeton University Press. (First edition)
- 3) Handbook of X-ray astronomy – Edited by Keith A Arnaud, Randal K Smith and Aneta Siemiginowska, Cambridge University Press. (First edition)
- 4) Handbook of infrared astronomy by I S Glass, Cambridge University Press.(First edition)
- 5) Galactic Dynamics by James Binney and Scott Tremaine, Princeton University Press.(Second edition)
- 6) The Physical Universe, An Introduction to Astronomy by Frank H Shu, Oxford University Press.(First edition)
- 7) The handbook of image processing by Richard Berry and James Bernel (Second edition)
- 8) Galaxies in the Universe: an Introduction by Linda S Sparke, John SGallagher III, Cambridge University Press. (Second edition)
- 9) An Introduction to Astrophysics, Baidyanath Basu, Prentice Hall India Pvt.Ltd. (First edition)
- 10) An Introduction to Modern Stellar Astrophysics – Dale A. Ostlie, Bardley W Carroll, Addison-Wisely (Second edition)
- 11) Astronomy Today by Eric Chaisson and Steve McMillan, Addison-Wisely (8thEdition).

PHY4E11: ADVANCED STATISTICAL MECHANICS (4C, 72 hrs)

Objectives:

- Compare different quasiparticles and understand the features of phonons.
- Understand the interactions in nonideal systems.
- Understand phase transitions and critical point phenomena in materials
- Illustrate Nyquist theorem and its importance

Course Outcome: After completion of the full course the student should be able to	Cognitive level
C.O.1: Illustrate how to find the total energy and specific heat as per Debye model in crystal lattice.	Analysis
C.O.2: Compare short distance and long distance interactions in nonideal systems	Analysis
C.O.3: Explain Landau's theory of phase transitions	Understand
C.O.4: Interpret the results of spectral analysis of fluctuations	Analysis

1. Thermodynamics of crystal lattice

The field of sound waves, phonons and second sound, The Debye model, Debye temperature, specific heat of solid in the Debye model (12hours)

2. Non ideal systems

Intermolecular interactions, Lennard Jones potential, Corrections to the ideal gas law, Van der Waals equation, Short distance and long distance interaction, The plasma gas and ionic solutions, The Debye - Huckel radius (14hours)

3. Phase transition

Critical point, First order phase transition, Phase diagrams, The theory of Lang and Lee, A dynamical model for phase transitions, Weiss theory of ferromagnetism, Second order phase transition, Landau theory, Critical point exponents, Chemical equilibrium and chemical reactions (15hours)

4. Ising model

Ising as a macroscopic model of phase transition, Why the Ising model is very important? Relationship between lattice models, models of ferroelectrics and Ising model, The classical formulation of the problem, Exact solutions, Drawbacks of the mean field approximation, The static fluctuation approximation as new method for solving the Ising problem (17hours)

5. Fluctuations

Fluctuations of macroscopic variables, Theory of random processes, Response and fluctuation, Correlation functions, Spectral analysis of fluctuations: the Wiener-Khintchine theorem, The Nyquist theorem, Applications of the Nyquist theorem (14hours)

Text Book : R. K. Pathria and Paul D. Beale : “Statistical Mechanics” (Butterworth - Heinemann,1996)

Reference Books:

1. Kerson Huang : “Statistical Mechanics” (second edition) (Wiley,1987)
2. B.K. Agarwal and Melvin Eisner :”Statistical Physics”
3. Guptha and Kumar : “Statistical Physics”
4. J.E. Meyer and M.G. Meyer, Statistical Mechanics, John Wiley

PHY4E12: MATERIALS SCIENCE (4C, 72 hrs)

Objectives

- To understand the different types of imperfections in solids.
- To understand the concepts of Phase diagrams and diffusion in solids.
- To understand the different ways of plastic deformation in crystals and factors affecting them.
- To have knowledge on engineering materials like polymers and ceramics.
- To know the important synthesis methods of nanomaterials and their basic characterization tools.
- To have a basic understanding of classification of carbon nanostructures

Course Outcome: After completion of the full course the student should be able to	Cognitive level
C.O.1: Acquire a basic understanding of the concept of formation of lattice defects in solids	Understand
C.O.2: Analyse the phase diagrams of single component, binary and ternary systems and diffusion in solids.	Analysis
C.O.3: Identify the cause of plastic deformation in crystals.	Apply
C.O.4: Distinguish polymers and ceramics in terms of , their classifications, structure and properties.	Analysis
C.O.5: Apply the ideas of synthetic approaches of nanomaterials and their characterization methods.	Apply
Understand the structure of buckminster fullerene, carbon nanotube, its classification and its applications.	Understand

1. Crystal Imperfections

Point imperfections- The geometry of dislocations- Other properties of dislocations- Surface imperfections (8 Hours)

Textbook: „ Materials Science and Engineering – A First Course“ – IV th Edition- V.Raghavan (Prentice-Hall of India- 1988) (Sections: 6.1 to 6.4)

2. Phase Diagrams & Diffusion In Solids (14 Hours)

The phase rule- Single component system- Binary phase diagrams- The Lever rule- Some typical phase diagrams and applications

Textbook: Materials Science and Engineering – A First Course – IV th Edition- V. Raghavan (Prentice-Hall India- 1988) (Sections: 7.1 to 7.7)

Fick's law and solutions- Applications based on the second law solution- The Kirkendall effect- The atomic model of diffusion- Other diffusion processes

Textbook: „ Materials Science and Engineering – A First Course“ – IV th Edition- V.Raghavan (Prentice-Hall of India- 1988) (Sections: 8.1 to 8.6)

3. Plastic Deformation And Fracture Of Materials (12 Hours)

The tensile stress- Strain curve- Plastic deformation by slip- Shear strength of perfect and real crystals-The stress to move a dislocation- Dislocation multiplication-Work hardening- The effect of grain size and precipitate particles on dislocation motion- Mechanism of creep.

Textbook: „ Materials Science and Engineering – A First Course“ – IV th Edition- V.Raghavan (Prentice-Hall India- 1988) (Sections: 11.1, 11.2, 11.3, 11.4, 11.6,11.7, 11.8, 11.10 & 11.11)

Ductile fracture- Brittle fracture- Fatigue fracture- Methods of protection against fracture.

Textbook: „ Materials Science and Engineering – A First Course“ – IV th Edition- V. Raghavan (Prentice-Hall of India- 1988) (Sections: 12.1, 12.2, 12.5 & 12.6

4. Engineering Materials (26 Hours)

Giant molecules-Linear polymers- Three dimensional polymers-Deformation of plastics-Electrical behavior of polymers-Stability of polymers

Textbook : „Elements of Materials Science“ –IIIrd Edition – Lawrence H. Van Vlack (Addison- Wesley Publishing Company Inc.1964.) (Sections : 7.1, 7.2, 7.4, 7.5, 7.6 & 7.7)

Ceramic phases- Silicate structures- Glasses- Electromagnetic behavior of ceramics- Mechanical behavior of ceramic materials.

Textbook : „Elements of Materials Science“ – IIIrd Edition – Lawrence H. Van Vlack (Addison- Wesley Publishing Company Inc. 1964.) (Sections : 8.1, 8.5, 8.6, 8.7 & 8.8) -18 Hours

Growth techniques of nanomaterials- Top-down Vs.Bottom-up technique-Lithographic process and its limitations- Nonlithographic techniques-Plasma arc discharge-Sputtering- Evaporation-Thermal evaporation- e-beam evaporation – Chemical vapor deposition- Molecular beam epitaxy-Other processes.

Textbook : „ Introduction to Nanoscience & Technology “- K.K. Chathopadhyay, A.N.Banerjee (Prentice-Hall of India -2011.) (Sections 6.2, 6.3, 6.4, 6.4.1, 6.4.2,6.4.3, 6.4.3.1, 6.4.3.2, 6.4.4, 6.4.6 & 6.4.9.)

- 8 Hours

5. Characterization of Nanomaterials- 12 Hours

Characterization tools of Nanomaterials - Scanning probe microscopy- Tunnelling current- Local barrier height- Applications of STM – AFM - Scanned – Proximity probe microscopes-Laser beam deflection - AFM cantilevers - piezoceramics - feedback loop-Alternative imaging modes - AFM and biology-Electron microscopy-Resolution

vs. magnification-Scanning Electron microscope - SEM techniques-Electron gun - Specimen interactions- Environmental SEM - Transmission electron microscopy – Buckminster fullerene-Carbon nanotube.

Textbook : „ Introduction to Nanoscience & Technology “- K.K.Chathopadhyay, A.N.Banerjee (Prentice-Hall of India -2011.) (Sections 7.1.2, 7.1.3.1, 7.1.3.2, 7.1.3.5, 7.2.1,7.2.2, 7.2.3, 7.2.4, 7.2.5, 7.2.6, 7.2.7, 7.3.1, 7.3.2, 7.3.3, 7.3.4, 7.3.5, 7.3.6, 7.3.7, 7.4, 8.2.1 & 8.2.2)

References:

1. Solid State Physics- A.J.Dekker (MacMillan India Ltd.- 1958)
2. Principles of the Solid State- H. V. Keer (Wiley Eastern – 1993)
3. Solid State Physics: Structure and Properties of Materials- M.A.Wahab (Narosa- 2007).
4. Materials Science and Processes – S.K. Hajra Choudhury (Indian Book Publishing Co.-2009)
5. Nanotechnology - Richard Booker, Earl Boysen (Wiley Publishing Inc. 2005).

PHY4E13: ELECTRONIC INSTRUMENTATION (4C, 72 hrs)

Objectives:

- To understand the working of general purpose electronic test and measurement devices voltmeters, ammeters, multi-meters, Q-meter etc.
- To understand the working of different signal generators like sine, square, pulse generator and oscilloscopes and their block diagrams and circuits.
- To understand the changes on a sensor while varying different physical parameters and quantifying them to design and make various transducers.
- To understand the basic principles and working of various computer controlled testing systems for checking audio amplifiers and radio receivers and microprocessor based measurements.
- To understand SCR controlled devices such as current rectifiers, SCR controlled dc motors, speed regulators

Course Outcome: After completion of the full course the student should be able to	Cognitive level
C.O.1: Students are able to design and convert a galvanometer into a voltmeter or an ammeter or design a general purpose multi-meter.	Analyse
C.O.2: Students are able to design different signal generators and quantify various signals using oscilloscopes	Analyse
C.O.3: Students are able to the explain the changes on a sensor while varying different physical parameters and quantifying them to design and make various transducers.	Apply
C.O.4: Students are able to explain the basic principles and working of various computer controlled testing systems for checking audio amplifiers and radio receivers and microprocessor based measurements.	Analyse
C.O.5: Students are able to explain the basic principle and working of SCR controlled current rectifiers, dc motors, armature current limiters	Analyse

1. Electronic Instrumentation for measuring basic parameters

Electronic DC voltmeters, DC voltmeter circuit with FET, amplified voltage and current meter, chopper stabilized amplifier, electronic AC voltmeters (average responding, peak responding and true rms responding types), electronic multimeters , differential voltmeters –digital voltmeters (ramp and staircase type), RF millivoltmeter, Q meter (basic circuit and measurement methods, sources of error), bolometer and RF power measurement (14hours)

2. **Signal generators and oscilloscopes**

Standard signal generator, laboratory signal generator, AF sine wave and square wave generator, function generator and pulse generator, Block diagram of general purpose CRO, CRT circuits , vertical deflection system , delay line, multiple trace, horizontal deflection system, oscilloscope probes and transducers, oscilloscope technique, storage oscilloscopes, sampling oscilloscopes. (17hours)

3. **Fibre optic measurements and Transducers**

Sources and detectors, fibre optic power measurement, stabilized light sources, optical time domain reflectometer, Classification of transducers – strain gauges – displacement transducers – temperature measurements – photosensitive devices - Radiation detectors – solid state and scintillation detectors – neutron detectors, ECG and EEG (brain imaging – X ray, CT, MRI and nuclear imaging) (18hours)

4. **Computer controlled test systems:**

Testing an audio amplifier – testing a radio receiver – instruments used in computer controlled instrumentation – IEEE 488 electrical interface – digital control – signal timing in a microprocessor based measurement. (11hours)

5. **Power control : SCR**

Control of current in rectifiers with an inductive load – triggering control by phase shifting – saturable reactor control – combined d.c. and phase control – on off pulse control of the SCR – SCR supply for d.c. motor – speed regulation by armature voltage and current control – armature current limiting control of low torque a.c. motors (12hours)

Textbooks:

- 1.Modern Electronic instrumentation and measurement technique – Albert D Helfrick and William D Cooper (Tata McGraw Hill) for modules 1, 3, 4 and second part of 2
- 2.Electronic Instrumentation – Second edition – H.S. Kalsi (Tata Mc Graw Hill) for modules 1 and first part of module 2
- 3.Principles of Medical electronics and bio medical instrumentation – C Rajarao and S.K. Gupta (Universities Press) for Transducers
- 4.Bio Instrumentation – John G Webster (Wiley student edition) – for Transducers
- 5.“Introduction to Experimental Nuclear Physics”, Singru, R.M., (Wiley Eastern, 1972). for transducers
- 6.“Engineering Electronics”, 2nd Edition, Ryder, J.D., (McGraw Hill, 1967) for module 5

PHY4E14: LASER SYSTEMS, OPTICAL FIBRES AND APPLICATIONS (4C, 72 hrs)

Objectives:

- To understand the basic laser theory and various laser systems.
- To understand and describe the fundamentals of non linear optics.
- To study and understand the applications of lasers in various disciplines.
- To understand a comprehensive treatment of the Optical Fibers.

Course Outcome: After completion of the full course the student should be able to	Cognitive level
C.O.1: Understand the basic laser theory and the important laser systems.	Understand
C.O.2: Analyse the fundamentals of non linear optics and its applications.	Analyse
C.O.3: Identify the applications of lasers in various disciplines.	Apply
C.O.4: Learn the importance of materials in nanoscale region and the quantum effect of nanomaterials.	Understand
C.O.5: Identify applications of lasers in various disciplines.	Apply
Understand the basics of Optical Fibers and its applications.	Understand

1. Basic Laser theory

Einstein coefficients, Light amplification, The threshold condition, Line broadening mechanisms, Laser rate equations, Theory of Q-switched and Mode locked lasers, Cavity modes, stable and unstable resonators, Analysis of optical resonators. (18 hours)

2. Various laser systems

Ruby, Nd:YAG, Argon ion, He-Ne, CO₂ laser, Fiber Laser, Semiconductor Lasers, Optical parametric Oscillator – Working principle and energy level diagrams. (12 hours)

3. Nonlinear optics

Nonlinear polarization, Second and third Harmonic generation, Symmetry requirement for second Harmonic generation, Nonlinear refractive index, Multi photon absorption, Nonlinear materials, Four wave mixing and Z-scan Technique. (14 hours)

4. Laser Applications

Spatial frequency filtering, Holograpy, Industrial application of lasers, Lasers in medicine, Isotope separation, laser induced chemical reactions, Laser induced fusion (13 hours)

5. Optical Fibers

Introduction, What are optical fibers, Importance, propagation of light in optical fibers, Basic structure, Acceptance angle, Numerical aperture, Stepped index monomode fibers,

disadvantages, Graded index monomode fibers, Optical fibers as cylindrical waveguides, Scalar wave equation and the modes of a fiber, Modal analysis for a step index fiber, Single mode fibers. (15 hours)

Textbooks:

1. K.Thyagarajan and Ajoy Ghatak : “LASERS :Fundamentals and Applications” (2nd Edition, Springer, 2010)
2. William T Silfvast :” Laser fundamentals” (2nd Edition, Cambridge University Press,2004))
3. B.B Laud : “Lasers and Nonlinear Optics” (3rd Edition, New age international Publishers,2011)
4. Ajoy Ghatak and K. Thyagarajan “Optical Electronics” (Cambridge University Press,1989)
5. John. M.Senior : “Optical Fiber Communications: Principles and Practice” (3rd Edition, Pearson Education India,2009)

Reference books

1. Subirkumar Sarkar :”Optical Fiber and Fiber Optic Communication Systems” (S. Chand & Co.)
2. Ajoy Ghatak and K. Thayagarajan : Introduction to Fiber Optics” (Cambridge University Press, 1998)

PHY4E15: COMMUNICATION ELECTRONICS (4C, 72 hrs)

Objectives

- To understand the different modulation techniques and their merits and benefits based on the circuit elements and signal to noise ratio.
- To understand basics of pulse modulated communication and digital ways to transmit these signals.
- To understand basics of AM and FM transmitters and receivers, working microwave systems
- To understand basics of continuous and discrete time signals, A/D and D/A conversions techniques for digital signal communication
- To understand the basics of radiation from an oscillating dipole, different types of antennas.

Course Outcome: After completion of the full course the student should be able to	Cognitive level
StC.O.1: Compare signal to noise ratios of Amplitude, Frequency and Angle modulation techniques based on circuit elements and signal to noise ratio.	Analysis
StC.O.2: Compare amplitude and time modulations techniques in pulse modulated systems, able to quantify the errors in digital communication and suggest methods to correct it.	Evaluate
DiC.O.3: Differentiate between the circuit elements of AM and FM transmitters and receivers, explain the working of microwave systems.	Understand
ClC.O.4: Classify signals based on time and frequency, differentiate the working of D/A and A/D convertors	Apply
ClC.O.5: Classify signals based on time and frequency, differentiate the working of D/A and A/D convertors, explain different techniques for terrestrial and extraterrestrial signal communications	Analysis

1. Amplitude and angle modulation:

Amplitude modulation – Amplitude modulation and demodulation circuits – single side band generation and detection – SSB balanced modulator – Comparison of signal to noise ratios – Frequency modulation - Phase modulation – Angle modulation circuits – Detection of FM signals –Foster–Seeley discriminator – Ratio detector Noise in FM (12hours)

2. Pulse modulation and digital communication

Elements of information theory – Pulse transmission – Pulse amplitude modulation – Pulse time modulation – Pulse code modulation – Coding – Codes – Error detector and correction codes – Digital carrier systems – Teleprinter and telegraph circuits (12 hours)

3. Communication systems

Receivers – Superheterodyne receiver – AM receivers – Automatic gain control – Communications receivers – FM receivers – Single and independent side band receivers. Transmitters – Telegraph transmitters AM transmitters – FM transmitters – Television transmitters HF radio systems – VHF/UHF systems – Microwave systems – Satellite communications (15hours)

4. Signals and Systems

Classifications of signals, concept of frequency in continuous - time and discrete -time signals. Theory of A/D and D/A conversion, Sampling of Analog signals, sampling Theorem. Quantization of continuous amplitude signal, Coding of quantized samples, Discrete time linear time invariant systems - Techniques of analysis of linear systems, Resolution of a discrete time signal into impulses- Response of LTI systems to arbitrary inputs :Convolution sum- properties of convolution and the interconnection of LTI systems-Casual LTI systems – Stability of LTI systems. (15hours)

5. Radiation and antennas

Potential functions and the EM field – Radiation from an oscillating dipole –Power radiated by a current element – Radiation resistance of a short dipole – Radiation from a quarter wave monopole - Directivity – Gain and effective aperture - Antenna arrays – Two element, linear and binomial – Frequency independent antennae – Log periodic antennae – Yagi antennae. Propagation of radio waves - Ground waves, Sky wave propagation, Space waves, Tropospheric scatter propagation, Extra terrestrial communication. Ionosphere –Reflection and refraction of waves by the ionosphere – Attenuation, Enough exercises. (18hours)

Text and Reference books:

1. “Electronic Communications”, Roddy and Coolen, J., (PHI, 1986). Chapters 7, 8, 9, 10, 11, 12, 18, 19
2. “Electronic Communication Systems”, 4th Edition, Kennedy, G. and Davis, B. (McGraw Hill, 1992). Chapter 6,8.
3. “Electromagnetic waves and Radiating Systems”, Jordan E.C. and Balmain, K.G. (PHI, 1979). Chapters 10,11,15,17.
4. “Digital Signal Processing” by Proakis and Manolakis, Prentice Hall of India (1997)

PHY4E16: SYNTHESIS, CHARACTERIZATION TECHNIQUES AND APPLICATIONS OF NANOMATERIALS (4C, 72 hrs)

Objectives:

- familiarize the students with the various physical and chemical approaches for the synthesis of nanomaterials and different characterization techniques to analyse the structure, morphology and various properties as well as their applications so that they can pursue this emerging research field as career.

Course Outcome: After completion of the full course the student should be able to	Cognitive level
CO1. Identify the different physical and chemical methods of synthesis of nanomaterials	Apply
CO2. Understand the working principles of optical property and compositional and morphological analysis related instrumentation techniques	Understand
CO3. Learn the fundamentals of electrical and magnetic property related instrumentation techniques	Understand
CO4. Recognize different application of nanomaterials in physics, chemistry and medicinal areas	Apply
CO5. Have a basic idea of nanomachines and nanodevices	Understand

1. Synthesis of Nanomaterials

Physical techniques- Mechanical method – High energy ball milling, Methods based on evaporation – Physical vapour deposition, laser ablation, laser pyrolysis, sputter deposition, chemical vapour deposition, ion beam technique molecular beam epitaxy. Chemical methods-nucleation and growth of nanoparticles, LB method, microemulsion, sol-gel process, hydrothermal, sonochemical, microwave synthesis, mechanism of molecular self- assemblies. (22 hours)

Textbook : Sections 3.2.1, 3.3.1, 3.3.3, 3.3.4, 3.4, 3.5, 3.7, 3.8, 4.3, 4.6-4.11, 6.2 Nanotechnology – Principles and Practices(Third edn), Sulabha K Kulkarni, Springer, 2015

2. Characterization Techniques

X-ray diffraction technique, Optical Spectroscopy – Raman, UV-Visible, Photoluminescence, Fourier Transform Infrared Spectroscopy, surface area analysis, light scattering method, Electron microscopy-Scanning Electron Microscopy, Transmission Electron Microscopy including high-resolution imaging, Scanning Probe Microscopy, Atomic Force Microscopy, X ray Photoelectron Spectroscopy, Thermal Analyser, Zeta potential (24 Hrs)

Textbook: Section 12.1-12.9, Nanomaterials and Nanocomposites-Synthesis, Properties, Characterization Techniques, and Applications, Rajendra Kumar Goyal, CRC Press, 2018

3. Electrical and Magnetic Measurement Techniques

VSM – SQUID – conductivity measurements – Four probe method – Two probe method. Hall effect method (8 hours)

- Textbooks** (1) Section 2.11.2,2.11.5, Introduction to Magnetic materials, B D Cullity, C D Graham John Wiley and sons 2009
- (2) Section 2.5, 3.1-3.4 Semiconductor material and Device Characterization, Dieter K Schroder, John Wiley sons 2008

4. Applications

Nanofluids, Hydrogen storage, solar energy, Antibacterial coatings, Self-cleaning coatings, Nanotextiles, Bio-medical fields (10 hours)

Textbook: Section 14.1-14.4, 14.8-14.10 Nanomaterials and Nanocomposites-Synthesis, Properties, Characterization Techniques, and Applications, Rajendra Kumar Goyal, CRC Press,2018

5. Nanomachines and Nanodevices

Microelectrmechanical systems, Nanoelectromechanical systems – Fabrication-Nanodevices and nanomachines-Molecular and supramolecular devices (8 hours)

Textbook: Chapter 13 Introduction to nanotechnology by Charles P Poole Jr. and Frank J Owens, John Wiley and Sons 2003

Textbooks

1. Nanotechnology – Principles and Practices(Third edn), Sulabha K Kulkarni, Springer, 2015
2. Nanomaterials and Nanocomposites - Synthesis, Properties, Characterization Techniques, and Applications, Rajendra Kumar Goyal, CRC Press, 2018
3. Introduction to Magnetic materials, B D Cullity, C D Graham John Wiley and Sons, 2009
4. Semiconductor material and Device Characterization, Dieter K Schroder, John Wiley and Sons, 2008
5. “Introduction to nanotechnology” by Charles P Poole Jr. and Frank J Owens, John Wiley and Sons 2003

Reference books

- 1 Physics of Low Dimensional Structures, J. H. Davis, (Cambridge Press), 1998.
2. Semiconductor Quantum Dots, L. Banyai and S. W. Koch, World Scientific 1993
3. Low Dimensional Semiconductors, M. J. Kelly, Clarendon,1955.
4. NanoTechnology: Principles and Practices, Sulabha Kulkarni, CPC-New Delhi 2007
5. Nano: The essentials: Understanding nanoscience and Nanotechnology, Pradeep T TMCGH, New Delhi 2007
6. Nanomaterials and Nanocomposites-Synthesis, Properties, Characterization Techniques, and Applications, Rajendra Kumar Goyal, CRC Press, 2018
7. Characterization of Materials, J. B. Wachtman and Z. H. Kalman, Butterworth- Heinmann, USA, 1993.
8. Experimental Physics, Modern Methods, R. A. Dunlop, OUP, USA 1997
- 9 Instrumental Methods of Analysis, H. H. Willard, L. L. Merritt, J. A. Dean and F. A. Settle ,(CBS Pub.), 1986

PHY4E17: ASTROPHYSICS AND POSITIONAL ASTRONOMY (4 C, 72 hours)

Objectives : The aim and objective of the course on Astrophysics and Positional Astronomy is to introduce the students to the fundamental astronomical techniques and various aspects of positional astronomy. This course provide a detailed study on galaxies.

Course Outcome: After completion of the full course the student should be able to	Cognitive level
C.O.1: Identify the position of an astronomical object in terms of the astronomical parameters.	Apply
C.O.2: Understand the fundamentals of astronomical techniques and to use different tools for astronomical studies.	Apply
C.O.3: Describe the rotation of Milky way galaxy and to understand the magnetic fields and cosmic rays present within the galaxy.	Analyse
C.O.4: Interpret the morphological structures and spectra of external galaxies and understand the interactions of galaxies and super-clusters.	Analyse
C.O.5: Understand the active galactic nuclei and its features and the basics of Unified Model of AGN.	Understand

1. Positional Astronomy

Introduction - Point in a plane, spherical surface, spherical triangle, Terrestrial latitude and longitude, Celestial sphere, Altitude and Azimuth, Standard celestial Sphere, Declination and hour-angle, Rotating sky, Ecliptic, Right Ascension and Declination, Celestial latitude and longitude, Galactic latitude and longitude, Conversion of coordinates, Time, Apparent and mean solar day, Local mean time, Sidereal time. (18 hours)

Textbook: Chapter 2.1 – 2.14 & 3.1 – 3.5 of A Textbook of Astronomy and Astrophysics by Mohit Kumar Sharma, Suresh Chandra

2. Fundamentals and Astronomical Techniques

Astronomical units of distance, parallax, electromagnetic spectrum, luminosity of a star, magnitude scale, Spectral classification, Black body radiation, Doppler red-shift, Relation between B-V magnitude and Surface temperature - Determination of radius of a star, HR diagram.

Tools of Astronomy

Features of Telescopes, Atmospheric distortion, Optical Telescopes, Lens, refractor, mirror and reflector telescopes, Aberrations, limitations of lens telescope, Adaptive optics, Radio Telescopes, Space based telescopes, detectors and observatories Gravitational Waves detectors and Neutrino detectors All-Sky Surveys and Virtual Observatories. (18 hours)

Textbook: Chapter 4.5 – 4.15 & 5.1 – 5.12 of A Textbook of Astronomy and Astrophysics by Mohit Kumar Sharma, Suresh Chandra

3. Milkyway Galaxy

Introduction - Rotation of the Galaxy: Differential rotation, determination of the rotation parameters in the solar neighbourhood, radio observation of the galaxy at 21 cm Wavelength, Rotational curve - Oort's constants, density distribution of gas and spiral structure of the galaxy: radio and optical data, The general structure of the

galaxy, mass of the galaxy, magnetic field of the galaxy, Cosmic rays, continuous radio emission in the galaxy. (16 hours)

Text book : Chapter 16.1 – 16.10 of An introduction to astrophysics by Basu, Baidyanath and Chattopadhyay

4. External Galaxies and The Large scale structure:

Introduction - classification -morphological classification - distribution- luminosity distribution of galaxies - spectra of galaxies - local groups of galaxies - distance to galaxies - Nuclei of galaxies - theory of spiral structures of disk galaxies - dwarf and UCD galaxies - Clustering nature of galaxies - morphological classification of clusters - cD galaxies - interacting galaxies and galaxy mergers - superclusters (15 hours)

Textbook : Chapter 17.1 – 17.12 of An introduction to astrophysics by Basu, Baidyanath and Chattopadhyay

5. Active Galactic Nuclei:

Introduction - properties of Active Galactic nuclei- size of AGN - luminosity - classification - Seyfert, radio - quasars - blazars - Unified model of AGN (5 hours)

Textbook: Chapter 17.1 – 17.4 of An Introduction to Astronomy and Astrophysics by Pankaj Jain

Reference books

1. A Textbook of Astronomy and Astrophysics by Mohit Kumar Sharma, Suresh Chandra
2. An introduction to astrophysics by Basu, Baidyanath and Chattopadhyay
3. An Introduction to Astronomy and Astrophysics by Pankaj Jain

ELECTIVE -III

(Elective-III to be opted from PHY4E18 - PHY4E25)

PHY4E18: QUANTUM FIELD THEORY (4C, 72 hrs)

Objectives:

- To classify fields as classical fields and quantum fields and also as relativistic and nonrelativistic.
- To analyse in detail the procedure for quantisation.
- To illustrate the procedure for quantising spin-1/2 field, i.e. Dirac field.
- To analyse various interactions as current-current interactions.
- To introduce path integral formalism in quantum mechanics.

Course Outcome: After completion of the full course the student should be able to	
C.O.1: Understand the key concept of the use of harmonic oscillators as oscillatory quanta is introduced. Can carry out the canonical quantisation of electromagnetic and Schrodinger field.	Understand
C.O.2: Substantiate that for studying the behaviour of identical many particle system, like atoms, molecules, nuclei, quantisation is a must. Quasi particles are also introduced.	Apply
C.O.3: Understand electron-photon interaction at a more fundamental level.	Understand
C.O.4: All types of interactions can be analysed as current-current interactions. Nuclear decays can also be explained using this assumption.	Analyse
C.O.5: Tools like Feynman propagator and Greens functions can be made use of here.	Apply

1. Classical Field Theory

Harmonic oscillator, The linear chain - classical treatment, the linear chain-quantum treatment, classical field theory, Hamiltonian formalism, Functional derivatives , Canonical quantization of nonrelativistic fields, Lagrangian and Hamiltonian for the Schroedinger field, Quantization of fermions and bosons, Normalization of Fock states .(14hours)

Textbook : “Field Quantization” Greiner and Reinhardt (Spinger-Verlag -1996), Sections 1.3 – 1.5, 2.2,2.3, 3.1 – 3.3, Exercise 3.1

2. Canonical quantization of Klein Gordon and photon fields:

The neutral Klein – Gordon field Commutation relation for creation and annihilation operators, Charged Klein – Gordon field, Invariant commutation relations, Scalar Feynman propagator, Canonical quantization of photon field - Maxwell’s equations, Larangian density for the Maxwell field,

Electromagnetic field in the Lorentz gauge, Canonical quantization of the Lorentz gauge – Gupta-Bleuler method, Canonical quantization in the Coulomb gauge (20hours)

Textbook : “Field Quantization” Greiner and Reinhardt (Spinger-Verlag -1996), Sections 4.1, 4.2, 4.4,4.5, 7.1 – 7.4, 7.7

3. Canonical quantization of spin $\frac{1}{2}$ fields

Lagrangian and Hamiltonian densities for the Dirac field, Canonical quantization of the Dirac field, Plane wave expansion of the field operator, Feynman propagator for the Dirac field (12hours)

Textbook : “Field Quantization” Greiner and Reinhardt (Spinger-Verlag -1996), Sections 5.1 – 5.4 4.

4. Interacting quantum fields and Quantum Electrodynamics

The interaction picture, Time evolution operator, Scattering matrix, Wick’s theorem, Feynman rules for QED, Moller scattering and Compton scattering (12hours)

Textbook : “Field Quantization” Greiner and Reinhardt (Spinger-Verlag -1996), Sections 8.2 – 8.6, Example 8.4

5. The path integral method

Path integrals in non-relativistic Quantum Mechanics, Feynman path integral, Multidimensional path integral, Time ordered product and n-point functions, Path integrals for scalar quantum fields, The Euclidian field theory, The Feynman propagator, Generating functional and Green’s function, Generating functional for interacting fields. (14 hours)

Textbook : “Field Quantization” Greiner and Reinhardt (Spinger-Verlag -1996), Sections 11.2 – 11.5, 12.1 – 12.5

References :

1. “Quantum Field theory”, Lewis H. Ryder (Cambridge University Press-1995)
2. “Field Theory – A modern primer” – Pierre Ramond (Bengamin – 1996)
3. “Quantum Field theory”, Itzyskon and Zuber (McGraw Hill –1989)
4. “Quantum Field theory”, Kerson Huang (Wiley)

PHY4E19: CHAOS AND NONLINEAR PHYSICS (4C, 72 hrs)

Objectives

- To familiarise the mathematical tools necessary for understanding the behaviour of nonlinear systems.
- To demonstrate Lagrangian formulation of mechanics and to analyse integrability criteria
- To analyse chaos in Hamiltonian systems.
- To understand the dynamics of dissipative systems.
- To understand the concept of Nonlinear waves and its properties

Course outcomes: After completion of the full course the student should be able to	
C.O.1: Illustrate different elliptic functions. To derive and qualitatively assess solutions of nonlinear differential equations	Analyse
C.O.2: Understand how canonical invariants helps to distinguish Integrable systems	Understand
C.O.3 Analyse surface sections for two degrees of freedom. Ideas of symplectic mapping could be discussed. Apply these to practical nonlinear problems especially in fluid mechanics	Analyse and apply
C.O.4: Discuss turbulence and bifurcation theory and the concept of strange attractors to make the qualitative assessment of the dynamics of a given dissipative system by applying a geometrical way .	Analyse
C.O.5: Apply necessary mathematical tools to find the solutions of nonlinear partial differential equations.	Apply

1. The Dynamics of Differential Equations

Integration of linear second order equations by quadrature, The damped oscillator, Integration of nonlinear second order equation, Jacobi elliptic functions, Weierstrass elliptic functions, Periodic structure of elliptic functions, The pendulum equation, Phase portrait of the pendulum, Phase portraits for conservative systems, Linear stability analysis, Linear stability matrix, Classification of fixed points, Examples of fixed point analysis, Limit cycle, Time dependent integrals, Non autonomous systems, The driven oscillator, Remarks on integration of differential equations, Elliptic functions .
(Chap 1, Tabor) (16 hours)

2. Hamiltonian Dynamics

Lagrangian formulation of mechanics, Lagrangian function and Hamilton's principle, Properties of the Lagrangian and generalized momentum, Hamiltonian formulation of mechanics, Hamilton's equations, Canonical transformations, The preservation of phase volume, The optimal transformation, Generating function, Hamilton Jacobi equation for one degree of freedom, Action angle variable for one degree of freedom, Integrable Hamiltonians, Separable systems, Properties of integrable systems, Examples of integrable systems, Motion on the tori, Fundamental issues, KAM theorem (Chap 2 and sec 3.4, Tabor) (15hours)

3. Chaos in Hamiltonian systems and area preserving mappings

Surface of section, Surface of section for two degrees of freedom Hamiltonians, The Henon Heiles Hamiltonian, The Toda lattice, Surface of section as a symplectic mapping, Twist maps, Mapping on the plane, Connection between area preserving maps and Hamiltonians, The standard maps, The tangent map, Classification of fixed points, Poincare Birkhoff fixed point theorem, Homoclinic and heteroclinic points, The intersection of H⁺ and H⁻ whorls and tendrils, Criteria for local chaos, Lyapunov exponents, Power spectra, Criteria for onset of widespread chaos, Method of overlapping resonances, Greene's method, Statistical concepts in strongly chaotic systems, Ergodicity, Mixing, The Baker's transformation and Bernoulli systems, Hierarchies of randomness, Hamiltonian chaos in liquids, Fluid mechanical background, The model system, Experimental results (Sec 4.1 to 4.8, Tabor) (16hours)

4. Dynamics of dissipative systems

Dissipative systems and turbulence, The Navier Stokes equations, The concept of turbulence-a Hamiltonian degeneration, Experimental observations on the onset of turbulence, Couette flow, Rayleigh-Benard convection, Landau-Hopf theory, Hopf bifurcation theory, Ruelle-Takens theory, Other scenarios, Fractals, Mathematical model of strange attractors, Lorentz systems, Variations on Lorentz model, The Henon map, Period doubling bifurcations - Period doubling mechanism - Bifurcation diagram - Behaviour beyond 1μ - Other universality classes (Sec. 5.1 to 5.5, Tabor) (15 hours)

5. Solitons summary of

Historical background, Russel's observations, The F U P experiment, Discovery of the soliton, Basic properties of KdV equations, Effects of nonlinearity and dispersion, The traveling wave solution, Enough exercises. (Sec 7.1 and 7.2, Tabor) (10 hours)

Textbook:

1. "Chaos and Integrability in Nonlinear Dynamics", M. Tabor (Wiley, New York)

References

1. "Chaos and Nonlinear Dynamics-An Introduction for Scientists and Engineers", R.Hilborn (Oxford University Press)

PHY4E20: ADVANCED CONDENSED MATTER PHYSICS (4C, 72 hrs)

Objectives

- To understand the idea of elementary excitation in solids
- To understand electron-electron interactions, electron-ion interactions and first principle approximations in solids.
- To understand the alloying phenomena in solids and physics of alloy formation
- To study band structure calculations, alloy super structures and quantum well structures
- To understand defects in solids and to study the various defects and imperfections in solids, alloys and compounds.
- To Study the science of nanoscale materials and nanostructures, types of nanostructures and energy density in various nanostructures.
- To Study thin film formation and factors affecting thin film formation and type as well as methods of thin film formation.

After completion of the full course the student should be able to	
C.O.1: Understand the concept of first principle approximation and the requirement of DFT and HF approximations in molecular modeling	Understand
C.O.2: Analyse the phase diagrams in alloy formations and formulations of ternary and quaternary compositions of compounds.	Analyse
C.O.3 Understand different types of defects in crystals	Understand
C.O.4: Analyse the importance of materials in nanoscale region and the quantum effect of nanomaterials.	Analyse
C.O.5: Understand the importance of 2-dimensional materials and their applications in recent technology and development and growth of thin films by different techniques.	Understand

1. Elementary Excitations in Solids

Interacting electron gas - Hartree Fock approximation; Plasmons and electron plasmon interactions; Linhard equation for dielectric constant of electron gas; Electron Hole interactions - excitons; Bloch and Wannier representations, Frenkel excitons, Ion-ion interactions, -classical equations of motion- Energy in lattice vibrations; Phonon dispersion relations - density of states Spin - spin interactions - magnons. (18 hours)

Textbook: Introduction to solid state theory, O Madlung, Springer NY 1978

2. Alloying phenomenon

Physics of alloy formation – Phase diagrams and alloy formation - Ternary groups and quaternary groups - band structure calculation of alloys superstructures - quantum well structures - super lattices (11hours)

Textbook: Semiconductor physics and Devices: S S Islam, Oxford

3. Defects in solids and strength of materials

Diffusion in solids, Vacancies, dislocations and mechanical strengths, ionic conductivity etching, photographic processes, radiation damage in solids, Fracture, Ductile and brittle fractures, Fracture mechanics, Fatigue, Crack initiation and propagation, Creep, Generalized creep behaviour, Stress and temperature effects. (14hours)

Textbook: Elementary solid state physics, Ali Omar; Pearson and Mechanical properties of matter: AH Cortell, Wiley NY.

4. Nano scale science and technology

Nano materials and Quantum mechanics- quantum dots-Three dimensional Systems(bulk materials)-two dimensional systems(films)-one dimensional systems(quantum wires)-Zero dimensional systems(quantum dots)- Energy levels of quantum dots- nano wires and nano tubessynthesis and applications (16 hours).

Textbook: Nano technology- Principles and fundamentals: Ed. Gunter ũ Schmid, Wiley

5. Thin Film Technology and Applications

Thin film Growth process- Nucleation & film growth- Semiconducting thin films-Vapour deposition techniques- Solution deposition techniques- Optoelectronic applications of thin films- Micro electronic applications, Enough exercises. (13 hours).

Textbook: Thin film devices and applications: Chpora & I Kaur, Plenum Press Thin Film Fundamentals: A Goswami New Age Publishers

Text and Reference books:

1. Solid State Physics: Structure and Properties of Materials by A. M. Wahab, (Narosa Publishing House, India) 2nd Edition2005
2. Elements of Solid State Physics (second Edition) by J. P. Srivatsava (Printice Hall of India)2001
3. Introductory Solid State physics by H. P. Myers (Taylor & Francis Ltd, London) 2nd Edition1998
4. Solid State Physics by Ashcroft & Mermin 1st edition 2003
5. Solid State Physics by C. M. Kachhava (Tata McGraw-Hill) 1st Edition1996
6. Solid State Physics by C. Kittel (Wiley, 7th Edition) 2004

PHY4E21: MODERN OPTICS (4C, 72 hrs)

Objectives:

- To understand the fundamentals of light propagation and polarization matrices
- To describe the phenomenon of optical coherence.
- To understand Interference and its applications.
- To describe diffraction and understand its mathematical perspective.
- To understand the central concepts of the optics of solids.

Course outcome: After completion of the full course the student should be able to	Cognitive level
C.O.1: Understand that optics is electrodynamics at high frequency and enable the him/her to develop concrete concepts regarding the fundamentals of light propagation and polarization matrices	Understand
C.O.2: Analyse the phenomenon of optical coherence and its applications.	Analyse
C.O.3: Understand the physical principles of coherence in interference and its applications.	Understand
C.O.4: Explain diffraction and establish its mathematical perspective in terms of Fourier .transforms.	Analysis
C.O.5: Understand the central concepts of the optics of solids.	Understand

1. Light Propagation and Vectorial Nature

Electromagnetic wave propagation, Harmonic waves, phase velocity, group velocity, Energy flow Poynting vector. Different polarizations – Matrix representations – Jones’s calculus. Ray vectors and ray matrices, Gaussian beams in homogeneous media, ABCD law. (13 hours)

2. Coherence

Principle of superposition – Theory of partial coherence and visibility of fringes - coherence time and coherence length – Physical origin of line width. Spatial coherence, Hanbury-Brown-Twiss experiment. Basic idea of Fourier Transform Spectroscopy. (13 hours)

3. Interference with multiple beams :

Interference with multiple beams – Fabry-Perot interferometer –Resolving power, applications. Theory of multilayer films. (9 hours)

4. Diffraction

Kirchoff’s theorem, Fresnel-Kirchoff formula, Babinet’s principle, Fresnel and Fraunhofer diffraction, Fraunhofer diffraction patterns of single slit, double slit and circular aperture, theory of diffraction grating. Fresnel diffraction pattern – zone plate, Rectangular aperture, Fresnel integrals, Corn spiral. Applications of Fourier transforms to diffraction. Aperture function, Apodization, Spatial filtering, phase contrast and phase gratings, wave form reconstruction by diffraction holography. (17 hours)

5. Optics of Solids

Microscopic fields and Maxwell's equations. Propagation of light in isotropic dielectric media. Dispersion-Sellmier's formula. Propagation of light in anisotropic media – double refraction, phase velocity surface, polarizing prisms. Optical activity, Faraday rotation in solids, Kerr effect and Pockel's effect (basic ideas only). Elements of nonlinear optics, Physical origin of nonlinearity. Second harmonic generation. Phase matching conditions. Applications of second harmonic generation, Enough exercises. (20 hours)

Textbooks :

1. G.R. Fowles, Introduction to Modern Optics (Dover Publishers) ISBN: 0486659577
2. A. Yariv, Optical Electronics (1985)

References:

1. S.G. Lupson, H.L. Upaon and D.S. Tannhauser, Optical Physics (Cambridge University Press)
2. A.N. Matvev, Optics (MIR Publishers)
3. Hecht, Optics (Addison Wealey)
4. Ajoy-Ghatak, Optics (Tata Mc Graw Hill)

PHY4E22: PHYSICS OF SEMICONDUCTORS (4C, 72 hrs)

Objectives

- To impart knowledge on the variation of band structure of semiconductors based on different internal and external parameters and introduce experimental techniques for the measurement of band structure and its variations
- To understand the carrier concentration and mobility in intrinsic and extrinsic semi conductors and the theory of transport of charge carriers.
- To study the different external factors that change the electrical nature of semi conductors and application of the phenomena
- To study Schottky barrier and P N junction and their characteristics based on the previous knowledge
- Understand the method of impurity profiling with capacitance measurement
- To understand the concept of traps, recombination and trap assisted phenomenon, photo-generation of charge carriers and their applications.
- To understand the phenomenon of the offset of semiconductor band near the junction

After completion of the full course the student should be able to	
C.O.1: Analyse the variation of band structure with temperature, doping concentrations etc and familiarize the experimental techniques	Analyse
C.O.2: Understand the non linear nature of electrical conductivity depending on doping concentration in different regions	Understand
C.O.3: Familiarize the concept of changing electrical parameters of semiconductors and the phenomena such as Hall effect and thermoelectric effect	Understand
C.O.4: Analyse the role of impurity profile on the device characteristic as applied to tunnel diode	Analyse
C.O.5: Describe the various trap and recombination mechanisms in semiconductors, phenomenon of electroluminescence. Understand the working of LED/ Laser diodes etc as application of trap centre	Analyse

1. Band structural aspects

Effects of temperature and electric field on band structure, Frank-Keldysh effect, Localized states of impurities : theoretical models and experimental probes (Capacitive and spectroscopic techniques), optical properties : allowed and forbidden, and phonon assisted transitions and their spectral shapes, Burstein Moss effect, excitons : free and bound excitons. (14hours)

2. Statistical thermodynamics of carriers

Fermi level in intrinsic and doped materials, Non stoichiometric semiconductors, role of structural defects, Heavy doping and degeneracy, electrical conductivity, Hall effect – two band model, mobility of carriers, Mechanisms of scattering, measurements of mobility, recombination process, Boltzmann equation for electron transport, equilibrium and non equilibrium processes, effective mass and its measurement, Thermoelectric power, magneto resistivity. (17 hours)

3. Metal-semiconductor contacts

Schottky barrier, P-N junctions, theory of carrier transport in p-n junctions, characteristics of practical junctions and deviations from ideality, capacitance effects, space charge and diffusion capacitance, impurity profiling through capacitance measurements, tunnel diode and applications (14 hours)

4. Photoconductivity

Role of traps and recombination, photo voltaic devices for solar cells and radiation detection, luminescence, light emitting diodes and laser action in p-n junction diodes (10 hours)

5. Surface states

Band bending and effect on bulk properties, Thin film structures, low dimensional semiconductors, Quantum wells, multiple quantum well structures, quantum dot structures, methods of preparation, special characteristics and devices based on quantum wells, Quantum Hall effect, high electron mobility transistor , Enough exercises. (17 hours)

References :

1. R.A Smith – Semiconductors, Academic Publishers, Calcutta(1989)
2. A.B. Lev – Semiconductors and electron devices, Prentice Hall(1987)
3. M. Shur – Physics of Semiconductor devices, Prentice Hall(1990)
4. S.M. Sze – Physics of Semiconductor devices, Wiley Eastern (1991)
5. W. Shockley – Electrons and Holes in semiconductors, D. Van Nostrand(1950)
6. W.C. Dunlop – An introduction to semiconductors, Wiley(1957)

Expected outcome

- Student learn about the variation of band structure with temperature, doping concentrations etc and familiarize the experimental techniques
- Student understand the non linear nature of electrical conductivity depending on doping concentration in different regions
- Students familiarize the concept of changing electrical parameters of semiconductors and the phenomena such as Hall effect and thermoelectric effect
- Student understand the role of impurity profile on the device characteristic as applied to tunnel diode
 - Student lean the various trap and recombination mechanisms in semiconductors, phenomenon of electro luminescence. Understand the working of LED/ Laser diodes etc as application of trap centre

PHY4E23: MICROPROCESSORS, MICROCONTROLLERS AND APPLICATIONS (4C, 72 hrs)

Objectives:

- To impart basic knowledge on the internal architecture of typical microprocessors and idea of Assembly language programming.
- Introduce basic concepts of microprocessor timings and memory/IO device interfacing.
- Provide adequate understanding about the general purpose interfacing chips required for microcomputer design.
- Familiarize the internals of typical AVR microcontrollers and idea of Assembly language programming.
- Introduce essential knowledge on Assembly and C language programming of AVR microcontrollers leading to design of simple embedded systems.

Course Outcome: After completion of the full course the student should be able to	Cognitive level
C,O,1: to be equipped with essential knowledge on design and programming of simple microprocessor based systems.	Apply
C.O.2: develop basic skills in design of simple AVR microcontroller based embedded systems	Create

1. Microprocessor and Assembly language programming

Microprocessor as CPU, Internal architecture of Intel 8085, Instruction set, Addressing modes, Examples of Assembly language programming, Addition and subtraction of 2 byte numbers, multiplication and division of 1 byte numbers, Sorting of 1bytenumbers (12 hrs)

Textbooks: 1. Introduction to Microprocessors–A.P. Mathur (Tata-McGrawHill).

2. Fundamentals of Microprocessors and Micro Computers”– B. Ram- DhanapatiRai

2 Microprocessor timings, Interfacing memory and I/O devices

Instruction cycles, machine cycles and timing diagram, address space partitioning, generation of control signals for memory and I/O device interfacing, memory interfacing, I/O device interfacing, Address decodingusing74LS138 (10hrs)

Textbooks: 1. “Introduction to Microprocessors” –A.P. Mathur (Tata-McGraw Hill).

2 Fundamentals of Microprocessors and Micro Computers”– B. Ram- Dhanapati Rai

3 **Peripheral devices and interfacing**

Programmable Peripheral Interface- Intel 8255, Programmable Interval Timer- Intel 8253, Programmable DMA controller- Intel 8257, Programmable Interrupt controller- Intel 8259. ADC interfacing - General idea with block diagram, 7 segment LED display interfacing – General idea of display and driver (16 hrs)

Textbooks 1. Fundamentals of Microprocessors and Micro Computers– B. Ram – Dhanapati Rai
2. Introduction to Microprocessors –A.P. Mathur (Tata-McGrawHill).
3. Microprocessors – Architecture, Programming and Applications with 8085 - R.S.Gaonkar (Wiley Eastern)

4 **Microcontrollers and Programming**

Microcontroller vs microprocessor, microcontrollers in embedded systems. Overview of AVR family of microcontrollers, simplified block diagram of AVR microcontroller, General idea of ROM, RAM, EEPROM, I/O pins and peripherals in microcontroller.

AVR architecture and Assembly level programming – General purpose registers, Data memory and instructions, status register and instructions, branch instructions, call and time delay loops; Assembler directives, sample programs.

Textbook : (Relevant sections from chapters 1,2 and 3: Textbook 4)

Arithmetic and logical instructions –sample programs. (16 hrs)

Textbook : (Relevant sections from chapters 5: The Book 4)

5. **AVR Programming**

I/O programming, I/O port pins and functions, features of ports A, B, C and D, dual role of Ports, sample programs. I/O ports and bit addressability.

Textbook : (Relevant sections from chapter 4: Book 4)

AVR programming in C:

C language data types for AVR, C programs for arithmetic, logic time delay and I/O operations. (18 hrs)

Textbook : (Relevant sections from chapter 7: Book 4)

Textbooks:

1. Introduction to Microprocessors–A.P. Mathur (Tata-McGrawHill).
2. Fundamentals of Microprocessors and Micro Computers”– B. Ram- Dhanapati Rai
3. Microprocessors – Architecture, Programming and Applications with 8085 – R.S. Gaonkar (Wiley Eastern)
4. The AVR microcontroller and embedded systems – using Assembly and C. Muhammad Ali Mazidi, Sarmad Naimi, Sepehr Naimi, Prentice Hall - Pearson

References: 1. Programming and customizing the AVR microcontroller: Dhananjay V Gadre.

2. Embedded C programming and the Atmel AVR: Barnett, Cox, O’Cull. Practical for Semesters III & IV

PHY4E24: BIOPHYSICS (4C, 72 hrs)

Objectives:

- The main objective is to give exposure and orientation of different aspects of biophysics to the students coming with a background of physics

Course Outcome: After completion of the full course the student should be able to	Cognitive level
C.O.1: Appreciate the physical mechanism of plant and animal tissues	Understand
C.O.2: Identify and understand the foundations of Biophotonics and Biosensing	Analyse
C.O.3: Understand basic principles, mechanisms of action and applications of biosensors in different scenarios	Understand
C.O.4: Analyse biomaterials and composites through theory and experiments	Analyse
C.O.5: Understand the applications of biomaterials in Medicine and dentistry	Understand

1. Basic Concepts in Biophysics

Macromolecular Structure - Nucleic acid and Protein structure. Energy Pathways in Biology – Free energy, coupled reactions, Group Transfer Potential - Photosynthesis, Energy Conversion Pathways, Membrane Transport. Rates of reaction, Transport processes, Protein folding. Introduction to Neuro-biophysics, Biomechanics – Introduction - Striated Muscles – Mechanical Properties of Muscles, Biomechanics of Cardiovascular system (24 hours)

Textbooks: Chapters 10,11,12,13.1-13.3 Biophysics, V. Pattabhi and N. Gautham, Narosa Publishing House
Section 7.4, 7.5 Biophysics: An introduction, Rodney M.J. Cotterill, Wiley

2. Nanotechnology for Biophotonics - Bionanophotonics

Interface of Bioscience, Nanotechnology & Photonics and Nanochemistry, Semiconductor Quantum dots for bio imaging, Metallic nanoparticles and nanorods for biosensing (10 hours).

Textbook: Section 15.1 -15.4 Introduction to Biophotonics, Paras N Prasad; John Wiley & Sons, 2003

3. Biosensors

Introduction-Recent development topics on biosensors-Electrochemical biosensors-Carbon nanotube biosensor-Protein engineering for biosensors-Wireless biosensors networks. Optical biosensors – Principles of optical biosensing – Fibre optic, planar wave guide, Evanescent wave, Interferometric, Surface plasmon resonance biosensors, Some recent novel sensing methods (18 hours)

Textbook : A roadmap of Biomedical engineers and milestones, Section 1, 2.1-2.5 Biosensors and Their Principles , Ahmet Koyun, Esma Ahlatcioglu Ozerol and Yeliz Ipek, Intech Open, 2012

Section – 9.2, 9.4 – 9.9, Introduction to Biophotonics, Paras N Prasad; John Wiley & Sons, 2003

4. Biomaterials

Ceramics-Bioinert-Bioactive and bioresorbable ceramics, FRPs, fabric glasses, Bioglasses - Natural materials-Composites -Thin films, Grafts, Coatings – Fabrics-Biologically functional materials-Classes of Materials used in medicine: Metals-Polymers-Hydrogels-Bioresorbable and Bioerodible materials (14 hours)

Textbook: Section: 2.2 – 2.11 Biomaterials Science: An Introduction to Materials in Medicine, Buddy D Ratner, Allan S Hoffman, Frederick J Schoen, Jack E Lemons, Academic Press, 1st edition, 1997

5. Applications of biomaterials in Medicine and dentistry

Cardio vascular – Non-thrombogenic treatment and Strategies-Dental implants – Adhesives and sealants – Ophthalmologic applications – Orthopedic applications – Drug delivery systems – Sutures – Burn dressings – Bioelectrodes (14 hours)

Textbook: Section 7. 7.2-7.12 Biomaterials Science: An Introduction to Materials in Medicine, Buddy D Ratner, Allan S Hoffman, Frederick J Schoen, Jack E Lemons, Academic Press, 1st edition, 1997

Textbooks

1. Biophysics, V. Pattabhi and N. Gautham, Narosa Publishing House, 2002

PHY4E25: SPACE PHYSICS (4 C, 72 hours)

Objectives :

- The aim and objective of the course on Space Physics is to give the basic understanding of the different divisions of Space Physics to M.Sc. Students. This course introduces fundamentals of Solar Physics, Atmospheric Physics and Ionospheric studies, Planetary Science and Satellites to equip the students for undertaking basic research works in the concerned field.

Course Outcome: After completion of the full course the student should be able to	Cognitive level
C.O.1: understand structure of Sun, different forms of solar discharges and planetary magnetospheres	Understand
C.O.2: describe the different dynamical processes happening in the earth's atmosphere and causes of climate changes.	Analyse
C.O.3: identify the importance and features of Ionosphere and to understand how it helps the communication systems.	Apply
C.O.4: understand the two-body problem and three-body problem and identify different types of planets and describe planetary motions,	Apply
C.O.5: Appreciate the different types of satellites and to understand the satellite communication systems.	Understand

1. Introduction to solar physics

Sun and the solar corona, the sunspots and solar cycle, solar flares, solar wind and the heliosphere, planetary magnetospheres. (6 hours)

Textbook : Fundamental Planetary Science: Jack Lissauer & Imke de Pater , Sections 7.1-7.32

2. Atmosphere and its effects

The Neutral atmosphere, atmospheric nomenclature, geopotential height, expansion and contraction, fundamental forces in the atmosphere, apparent forces, atmospheric composition, solar radiation interaction with the neutral atmosphere, climate change (12 hours)

Textbook : Fundamental Planetary Science: Jack Lissauer & Imke de Pater, Sections 2.1-2.2, 5.1-5.2, 5.4
An Introduction to Dynamic Meteorology – James R Holton 1.4 - 1.5.4

3. Ionosphere

Formation of the ionosphere, morphology of ionosphere, the D, E and F-regions, Ionospheric variations, chemistry of the ionosphere, ionospheric parameters, E and F region anomalies and irregularities in the ionosphere, the aurora, Lyman glow of the night sky, the geo-corona and airglow studies, ionosondes (14 hours)

Textbook: Introduction to Ionospheric Physics – Henry Rishbeth and Owen K. Garriot. Sections 3.1-3.7

4. Planetary Science

Overview of Solar system - Dynamics: Two-body problem, Three-Body Problem (Lagrangian points) - Planetary Atmospheres: Structure, Composition, Atmospheric Escape - Planetary surfaces: Surface morphology - Impact cratering - Minor Bodies: Meteorites, Asteroids, Comets, Minor planets, Trans-Neptunian Objects, Centaurs - Planetary rings - Planet formation: Evolution of protoplanetary disks, Growth of solid bodies, Formation of Terrestrial and Giant planets - Planetary Migration: - Extrasolar Planets: Detection techniques - Estimating planetary masses, sizes, orbital parameters, light curves -- Habitable zones: factors influencing habitable zone - continuously habitable zone - Missions to study Planets and Extrasolar planets (20 hours)

Textbook: Fundamental Planetary Science: Jack Lissauer & Imke de Pater, Sections 2.1-2.2, 6.3-6.4, 12.1-12.2, 12.6-12.8, 14.1, 15.3-15.7

5. Satellite Communication

Satellite System – Historical development of satellites – communication satellites – orbiting satellites – satellite frequency bands – satellite multiple access formats, satellite orbits and inclination – Look angles, orbital perturbations, spacecraft and its subsystems – altitude and orbit control system – Telemetry, Tracking and Command, Power system – Transponder – Reliability and space qualification – launch vehicles (20 hours)

Textbook : Satellite Communication – Robert M. Gagliardi Sections 1.1 - 1.6

Satellite Communication – Manojit Mit 2.1-2.4, 3.1-3.8

Textbooks for study

1. An Introduction to Dynamic Meteorology – James R Holton.
2. Lectures on Solar Physics H.M. Antia, A. Bhatnagar, Peter Ulmschneider Springer, 11-Jan-2008
3. Introduction to Ionospheric Physics – Henry Rishbeth and Owen K. Garriot.
4. Fundamental Planetary Science: Jack Lissauer & Imke de Pater (Latest Edition) - Cambridge University Press
5. Satellite Communication – Robert M. Gagliardi
6. Satellite Communication – Manojit Mit

Reference Books:

1. Climatology, An atmospheric Science – John E. Oliver and John J. Hindore.
2. Electronic Communication systems – George Kennedy and Bernard Davis.
3. The Solar System: Therese Encrenaz and Jean-Pierre Bibring (Latest Edition) - Astronomy and Astrophysics Library, Springer
4. The Origin and Evolution of the Solar System: Michael M. Woolfson - IoP CRC Press.
5. Exoplanets - Edited by Sara Seager - University of Arizona Press 2011
6. Moons and Planets, W.K. Houtmann, Wadsworth Publishing Company 4th Ed.

a) PHY3L05 & PHY4L06 (MODERN PHYSICS)

External Practical Exam for PHY3L05 & PHY4L06 together will be conducted at the end of 4th semester.

At least **10** experiments are to be done from **Part A** and 2 each from the elective paper as listed in **Part B**. If no practicals have been given for a particular elective papers, two more experiments from Part A should be done. It may be noted that some experiments are given both in Part A and B – of course such experiments can be done only once: either as included in part A or in part B. Internal evaluation to be done in each semester and final grades to be intimated to the controller at the end of 2nd and 4th semesters. One mark is to be deducted from internal marks for each experiment not done by the student if the required total number of experiments are not done in the semesters. The PHOENIX/EXPEYES Experimental Kit developed at the Inter University Accelerator Centre, New Delhi, may be used for experiments wherever possible.

PART A

1. G. M. Counter plateau and statistics of counting - To obtain the plateau, operating voltage and to verify the distribution law satisfied by the radioactive decay
2. Absorption coefficient for beta & gamma rays -To determine the absorption coefficient of the given materials using a G. M. Counter
3. Feather analysis – End point energy - To determine the end point energy of the beta particles from a given source using Feather analysis
4. Scintillation counter - To calibrate the given gamma ray (scintillation) spectrometer using standard gamma sources and to determine the energy of an unknown gamma ray source
5. Compton scattering - To verify the theoretical expression for the energy of the Compton scattered gamma rays at a given angle using a Scintillation gamma spectrometer / determine the rest mass energy of the electron
6. Half life of Indium – thermal neutron absorption - To determine the half life of In-116 by irradiation of In foil and beta counting using a GM counter
7. Photoelectric effect in lead - To get the spectrum of X rays emitted from lead target by photo electric effect using Cs-137gammas
8. Conductivity, reflectivity, sheet resistance and refractive index of thin films
9. Hall effect in semiconductors-To determine the carrier concentration in the given specimen of semiconducting material
10. ESR spectrometer – Determination of g factor
11. Rydberg constant determination
12. Absorption spectrum of KMnO₄ and Iodine. To determine the wavelength of the absorption bands of KMnO₄ and to determine the dissociation energy of iodine molecule from its absorption spectrum.
13. Ionic conductivity of KCl / NaCl crystals
14. Curie Weiss law -To determine the Curie temperature
15. To study the thermoluminescence of F-centres of Alkali halides
16. Variation of dielectric constant with temperature of a ferroelectric material (Barium Titanate)
17. Polarization of light and verification of Malu'slaw.
18. Refractive index measurement of a transparent material by measuring Brewster's angle
19. Measurement of the thermal relaxation time constant of a serial light bulb.
20. Dielectric constant of a nonpolar liquid
21. Vacuum pump – pumping speed
22. Pirani gauge –characteristics
23. Ultrasonic interferometer. To determine the velocity and compressibility of sound in liquids.
24. Study of LED characteristics - Determination of wavelength of emission, I-V characteristics and variation with temperature, variation of output power vs. applied voltage

25. Optical fibre characteristics - To determine the numerical aperture, attenuation and band width of the given optical fibre specimen
26. Band gap energy of Ge by four probe method.-To study bulk resistance and to determine band gap energy.
27. Thomson's e/m measurement.-To determine charge to mass ratio of the electron by Thomson's method.
28. Determination of Band gap energy of Ge and Si using diodes.
29. Millikan's oil drop experiment to measure the charge on the electron.
30. Zener voltage characteristic at low and ambient temperatures – To study the variation of the Zener voltage of the given Zener diode with temperature
31. Thermionic work function – To determine the thermionic work function of the material of the cathode of the given vacuum diode/triode from the characteristic at different filament currents.

PART B

I. DIGITAL SIGNAL PROCESSING

- 1 (a) Compute and plot the cross and auto correlation coefficients of one dimensional signal (b)Estimate the pitch period of a periodic signal using correlation method. (3hours).
- 2 (a) Compute and plot the convolution coefficients of one dimensional signal . (b)Estimate the pitch period of a periodic signal using convolution method. (3hours).
- 3 Write a program for determining the Linear and circular Convolution of a finite sequence $x(n)$ and $h(n)$.Accept the sequences $x(n)$ and $h(n)$ from the user. Display the output sequence $y(n)$.Plot all three sequences. (3hours).
- 4 Compute the N-point DFT of the following. Vary the value of N and visualize the effect with $N=8, 16, 24, 64,128,256$. (3hours).
- 5 Design an N point FIR low pass filter with cutoff frequency $0.2 * \pi$ using i) Rectangular ii) Hamming iii) Kaiser windows. Plot for $N=16,32,64,128,256$.Comparewith $N=1024$ and record your observations. (3hours).

(The programs are to be executed in Python/MATLAB)

II. EXPERIMENTAL TECHNIQUES

1. Rydberg constant – hydrogen spectrum
2. ESR – Lande g factor
3. IR spectrum of few samples
4. Vacuum pump – pumping speed
5. Vacuum pump – Effect of connecting pipes
6. Absorption bands of Iodine
7. Vibrational bands of AlO
8. Pirani gauge –characteristics
9. Thin films – electrical properties (sheet resistance)
10. Thin films – optical properties (Reflectivity, transmission, attenuation, refractive index)

III. ADVANCED NUCLEAR PHYSICS and RADIATION PHYSICS

1. Half-life of Indium – thermal neutron absorption - To determine the half-life of In-116 by irradiation of In foil and beta counting using a GM counter.
2. Alpha spectrometer - To calibrate the given alpha spectrometer and determine the energy resolution.
3. Photoelectric effect in lead - To get the spectrum of X rays emitted from lead target by photo electric effect using Cs-137gammas.
4. Inner bremsstrahlung - To study the intensity spectrum of inner bremsstrahlung from given gamma source.
5. Coincidence circuits - To construct and study the performance of series and parallel coincidence circuits using transistors and to determine the resolving time.
6. Single channel analyzer - Study of characteristics of a SCA using precision pulser.
7. Ionization chamber - Study of variation of pulse height with applied voltage and to obtain the pulse height spectrum of X-rays.
8. Proportional counter - Study of variation of pulse height with applied voltage and to obtaining the pulse height spectrum of X-rays.
9. Track detector – track diameter distribution - To measure the diameters of the alpha tracks in CR-39 track detector.
10. Beta ray spectrometer - To plot the momentum distribution of beta particles from given beta sources.
11. Range of alpha particles in air and mylar - To determine the range of alpha particles from Am-241 source in air and in mylar using either a surface barrier detector or a GM counter.

IV. MATERIAL SCIENCE / CONDENSED MATTER PHYSICS

1. Curie-Weiss law – To determine the Curie temperature.
2. Solid-liquid phase transitions – measurement of resistivity of metals.
3. Growth of a single crystal from solution and the determination of structural, electrical and optical properties.
4. Study of colour centres – Thermoluminescence glow curves.
5. Ionic conductivity in KCl / NaCl crystals.
6. Thermoluminescence spectra of alkali halides.
7. Thermo emf of bulk samples (Al/Cu).
8. Electron spin resonance.
9. Strain guage – Y of a metal beam.
10. Variation of dielectric constant with temperature of a ferroelectric material (Barium titanate).
11. Ferrite specimen – variation of magnetic properties with composition.

V. ELECTRONIC INSTRUMENTATION

1. Strain gauge.
2. Simple servomechanism.
3. Temperature control.
4. Coincidence circuits.
5. Multiplexer.
6. IEEE 488 Electrical interface.
7. Single channel analyzer.
8. Differential voltmeter.
9. Frequency synthesizer – Signal generator.
10. Silicon controlled rectifier – characteristics.
11. Silicon controlled rectifier – power control.

VI. LASER SYSTEMS, OPTICAL FIBRES AND APPLICATIONS

1. Optical fibre characteristics (numerical aperture, attenuation and bandwidth).
2. Optical feed back circuit (feedback factor, gain and frequency response).

3. Determination of the size of lycopodium particles by laser diffraction.

VII COMMUNICATION ELECTRONICS

1. Amplitude modulation and demodulation.
2. Frequency modulation and demodulation.
3. Pulse amplitude modulation and demodulation.
4. Pulse code modulation and demodulation.
5. Pulse position modulation and demodulation.
6. Study of crystal detector.
7. L-C transmission line characteristics.
8. Tuned RF amplifier.
9. Seely discriminators.
10. AM transmitter.
11. Radiation from dipole antenna.
12. Optical fibre characteristics (Numerical aperture, attenuation and band width).
13. Optical feed back circuit (Feedback factor, gain and frequency response).

VIII. MICROPROCESSORS, MICROCONTROLLERS AND APPLICATIONS

1. Simple temperature control circuit.
2. Binary rate multiplier.
3. Optical feed back amplifier.
4. Frequency modulation and pulse modulation.
5. Binary multiplier.
6. Write ALP and execute using 8085 kit for generating a square wave of desired frequency using PPI 8255 interfacing. observe the output on CRO and measure frequency.
7. Write ALP to alternately switch on/off a green and a red LED within a given small time interval. Execute using 8085kit.
8. Write ALP to convert a given d.c voltage (between 0 and 5 V) using ADC 0800/0808 interfaced to 8085 microprocessor. Execute using the given kit and check the result.
9. Setup an AVR microcontroller to switch on four LEDs one by one with a suitable time delay, using Assembly language programming.
10. Setup an AVR microcontroller to monitor the status of a switch. Drive a LED OFF if the switch is ON. Use C language programming

IX (i) INTRODUCTION TO NANOSCIENCE AND TECHNOLOGY

(ii) SYNTHESIS, CHARACTERISATION TECHNIQUES AND APPLICATIONS OF NANOMATERIALS

1. Synthesis of silver nanoparticles by chemical reduction method.
2. Synthesis of TiO₂ nanoparticles by Chemical sol-gel method.
3. Synthesis of metal sulphide nanoparticles by chemical precipitation method.
4. Synthesis of metal oxide nanoparticles by chemical precipitation method .
5. Synthesis of SnO₂ nanoparticles by chemical sol-gel method.
6. Determination of size distribution of aerosole droplets.
7. Determination of diffusion constant of dyes in Agarose medium.

X ASTROPHYSICS AND POSITIONAL ASTRONOMY

1. Use DS9 software to draw the surface profile of a galaxy (use Imexamine and Ximtool). Plot the graph and save it to the disk space.
2. Use Galfit to model an elliptical and lenticular galaxy.

- Use Vizier service to search and cross-match astronomical catalogues. Use TOPCAT to do the same and plot the sky coordinates.

b) PHY4L07: COMPUTATIONAL PHYSICS PRACTICAL

The programs are to be executed in Python. For visualization Pylab/matplotlib may be used. At least 10 experiments are to be done, opting any 5 from Part A and another 5 from Part B. The Practical examination is of 6 hours duration.

Part A

- Interpolation : To interpolate the value of a function using Lagrange's interpolating polynomial
- Least square fitting to obtain the slope and intercept by linear and Non-linear fitting.
- Evaluation of polynomials. Bessel and Legendre functions: Using the series expansion and recurrence relations.
- Numerical integration : By using Trapezoidal method and Simpson's method
- Solution of algebraic and transcendental equations .Newton Raphson method, minimum of a function
- Solution of algebraic equation by Bisection method
- Matrix addition, multiplication, trace, transpose and inverse
- Solution of second order differential equation- Runge Kutta method
- Monte Carlo method : Determination of the value of π by using random numbers
- Numerical double integration
- Solution of parabolic/elliptical partial differential equations
(e.g.: differential equations for heat and mass transfer in fluids and solids, unsteady behaviour of fluid flow past bodies, Laplace equation etc..)
- Tutorials on handling of data and getting familiar with data analysis package IRAF. This includes an introduction, beginner's tutorials and exercises in these software.
- Using IRAF and DS9, find the surface photometry of a galaxy (use Imexamine and Ximtool).
- Using IRAF, analyse the spectrum of a galaxy.
- Introduce Archival Data - SIMBAD, VIZIER, NED.
- Use Vizier X-match to collect and analyse quasar catalogues from multi-band surveys.

Part B

- To plot the trajectory of a particle moving in a Coulomb field (Rutherford scattering) and to determine the deflection angle as a function of the impact parameter
- Generate phase space plots - To plot the momentum v/s position plots for the following systems :
(i) a conservative case (simple pendulum) (ii) a dissipative case (damped pendulum)

- Simulation of the wave function for a particle in a box - To plot the wave function and probability density of a particle in a box; Schrödinger equation to be solved and eigenvalue must be calculated numerically.
- Simulation of a two slit photon interference experiment :To plot the light intensity as a function of distance along the screen kept at a distance from the two slit arrangement.
- Trajectory of motion of (a) projectile without air resistance (b) projectile with air resistance
- Logistic map function – Solution and bifurcation diagram
- Experiment with Phoenix/expEYES kit - Time constant of RC circuits by curve fitting.*
- Experiment with Phoenix/expEYES kit - Fourier analysis of different wave forms captured using the instrument. *
- (*If Phoenix is not available, data may be given in tabulated form)
- Simulation of Kepler’s orbit and verification of Kepler’s laws.
- Simulations of small oscillations in simple molecules:: Diatomic molecule/Triatomic molecule for various lengths(any one case)
- Simulation of random walk in 1D/2D and determination of mean square distance.
- Simulation of magnetic field - To plot the axial magnetic field v/s distance due to a current loop carrying current.
- Simulation of the trajectory of a charged particle in a uniform magnetic field.
- Simulation of polarisation of electromagnetic waves.
- Simulation of coupled oscillators - Phase space portraits.

 12. Frederic P. Miller Agnes F. Vandome, Mc Brewster John: IRAF, VDM Publishing, 2010.
 13. Chrisphin Karthick, M: Astronomical data Reduction guide.

Note: Experiments from Part A can be done with data from physical situations where ever possible. For example consider the following cases.

- a) The load W placed on a spring reduces its length L. A set of observations are given below. Calculate force constant and length of the spring before loading.

W (kg)	0.28	0.51	0.67	0.93	1.15	1.38	1.60	1.98
L (m)	6.62	5.93	4.46	4.25	3.3	3.15	2.43	1.46

- b) The displacements of a particle at different instants are given below. What is the time instant at which the displacement is 70.2m

t(s)	1.0	2.2	3.0	4.5	5.8	6.7	7.6	8.3	9.4
s(m)	3.0	10.56	19.07	37.12	59.16	77.38	98.04	115.78	146.6

PATTERN OF QUESTION PAPER

(for Core and Elective courses in I/II/III/IV Sem M.Sc Physics (CBCSS-PG) w.e. f 2019)

Code : (eg. PHY1C01) Subject (eg. Classical Mechanics)

Time:3Hours.

Total weightage : 30

Section A

(8 Short questions, each answerable within 7.5 minutes)

Answer all questions, each carries weightage 1

Question Numbers 1 to 8 Total weightage $8 \times 1 = 8$

Section B

(4 Essay questions, each answerable within 30minutes)

Answer ANY TWO questions, each carries weightage 5)

Question Numbers 9 to 12 Total weightage $2 \times 5 = 10$

Section C

(7 Problem questions, each answerable within 15 minutes)

Answer ANY FOUR questions, each carries weightage 3)

Question Numbers 13 to 19 Total weightage $4 \times 3 = 12$
